We consider the abstract Cauchy problem for differential equation of the hyperbolic type
\[ v''(t) + Av(t) = f(t) \quad (0 \leq t \leq T), \quad v(0) = v_0, \quad v'(0) = v'_0 \]
in an arbitrary Hilbert space $H$ with the selfadjoint positive definite operator $A$. The high order of accuracy two-step difference schemes generated by an exact difference scheme or by the Taylor decomposition on the three points for the numerical solutions of this problem are presented. The stability estimates for the solutions of these difference schemes are established. In applications, the stability estimates for the solutions of the high order of accuracy difference schemes of the mixed-type boundary value problems for hyperbolic equations are obtained.

1. The Cauchy problem

We consider the abstract Cauchy problem for hyperbolic equations

\[ v''(t) + Av(t) = f(t) \quad (0 \leq t \leq T), \quad v(0) = v_0, \quad v'(0) = v'_0 \]

in a Hilbert space $H$ with the selfadjoint positive definite operator $A$.

A function $v(t)$ is called a solution of the problem (1.1) if the following conditions are satisfied.

(i) $v(t)$ is twice continuously differentiable on the segment $[0, T]$. The derivatives at the endpoints of the segment are understood as the appropriate unilateral derivatives.

(ii) The element $v(t)$ belongs to $D(A)$ for all $t \in [0, T]$, and the function $Av(t)$ is continuous on the segment $[0, T]$.

(iii) $v(t)$ satisfies the equations and the initial conditions (1.1).

It is known (see, e.g., [7, 9]) that various initial boundary value problems for the hyperbolic equations can be reduced to the problem (1.1). A study of discretization, over time only, of the initial value problem also permits one to include general difference schemes in applications, if the differential operator in space variables, $A$, is replaced by the difference operators $A_h$ that act in the Hilbert spaces and are uniformly positive definite and selfadjoint in $h$ for $0 < h \leq h_0$.

In a large cycle of works on high order of accuracy difference schemes for hyperbolic partial differential equations (see, e.g., [1, 10] and the references given therein), stability
was established under the assumption that the magnitudes of the grid steps $\tau$ and $h$ with respect to the time and space variables are connected. In abstract terms this means, in particular, that the condition $\tau\|A_h\| \to 0$ when $\tau \to 0$ is satisfied.

Of great interest is the study of absolute stable difference schemes of a high order of accuracy for hyperbolic partial differential equations, in which stability was established without any assumptions with respect to the grid steps $\tau$ and $h$. In [4, 5, 12] the corresponding simple difference schemes of the first and second order of accuracy for hyperbolic partial differential equations were studied.

In the present paper the two-step difference schemes of a high order of accuracy generated by an exact difference scheme or by the Taylor decomposition on the three points for the numerical solutions of the problem (1.1) are presented. The stability estimates for the solutions of these difference schemes are established. In applications, the stability estimates for the solutions of the high order of accuracy difference schemes of the mixed-type boundary value problems for hyperbolic equations are obtained.

If the function $f(t)$ is not only continuous, but also continuously differentiable on $[0, T]$, $v_0 \in D(A)$, and $v'_0 \in D(A^{1/2})$, it is easy to show that the formula

$$v(t) = c(t)v_0 + s(t)v'_0 + \int_0^t s(t - \lambda)f(\lambda)d\lambda$$

(1.2)
gives a solution of problem (1.1). Here

$$c(t) = \frac{e^{itA^{1/2}} + e^{-itA^{1/2}}}{2}, \quad s(t) = A^{-1/2}e^{itA^{1/2}} - e^{-itA^{1/2}}/2i.$$  

(1.3)

Actually, obviously (1.1) can be rewritten as the equivalent initial value problem for system of the first-order linear differential equations

$$v'(t) + iBv(t) = z(t) \quad (0 \leq t \leq T), \quad v(0) = v_0, \quad v'(0) = v'_0,$$

$$z'(t) - iBz(t) = f(t),$$

(1.4)

where $B = A^{1/2}$. Integrating these, we at once obtain

$$v(t) = e^{-itB}v_0 + \int_0^t e^{-iB(t-s)}z(s)ds,$$

$$z(t) = e^{itB}z_0 + \int_0^t e^{iB(t-p)}f(p)dp.$$  

(1.5)

That is,

$$v(t) = e^{-itB}v_0 + \int_0^t e^{-iB(t-s)}e^{iBs}z_0ds + \int_0^t e^{-iB(t-s)}\int_0^s e^{iB(s-p)}f(p)dpds,$$  

(1.6)

so, using the condition $v'(0) + iBv(0) = z(0)$, we obtain

$$v(t) = \left( e^{-itB} + iB \int_0^t e^{-iB(t-s)}e^{iBs}ds \right)v_0 + \int_0^t e^{-iB(t-s)}e^{iBs}ds v'(0) + \int_0^t e^{-iB(t-s)}\int_0^s e^{iB(s-p)}f(p)dpds.$$  

(1.7)
By the interchange of the order of integration, we obtain
\[
\nu(t) = \left(e^{-iBt} + \frac{e^{iBt} - e^{-iBt}}{2i}\right)v_0 + B^{-1}e^{-iB(t-s)}ds\nu'(0)
+ \int_0^t B^{-1}e^{-iB(t-s)}f(s)ds.
\]

(1.8)

Thus, from that by the definitions of $B$, $c(t)$, and $s(t)$ we have (1.2).

**Theorem 1.1.** Suppose that $v_0 \in D(A)$, $v'_0 \in D(A^{1/2})$, and $f(t)$ are continuously differentiable on $[0,T]$ function. Then there is a unique solution of the problem (1.1) and the stability inequalities

\[
\begin{align*}
\max_{0 \leq t \leq T} \|\nu(t)\|_H & \leq M\left[\|v_0\|_H + \|A^{-1/2}v'_0\|_H + \max_{0 \leq t \leq T}\|A^{-1/2}f(t)\|_H\right], \\
\max_{0 \leq t \leq T} \|A^{1/2}\nu(t)\|_H & \leq M\left[\|A^{1/2}v_0\|_H + \|v'_0\|_H + \max_{0 \leq t \leq T}\|f(t)\|_H\right], \\
\max_{0 \leq t \leq T} \left\|\frac{d^2\nu(t)}{dt^2}\right\|_H & + \max_{0 \leq t \leq T} \|A\nu(t)\|_H \leq M\left[\|Av_0\|_H + \|A^{1/2}v'_0\|_H + \|f(0)\|_H + \int_0^T \|f'(t)\|_H dt\right]
\end{align*}
\]

(1.9)

hold, where $M$ does not depend on $f(t)$, $t \in [0,T]$, and $v_0$, $v'_0$.

**Proof.** Using the formula (1.2) and estimates

\[
\|c(t)\|_{H \rightarrow H} \leq 1, \quad \|A^{1/2}s(t)\|_{H \rightarrow H} \leq 1,
\]

we obtain

\[
\|\nu(t)\|_H \leq \|c(t)\|_{H \rightarrow H}v_0\|_H + \|A^{1/2}s(t)\|_{H \rightarrow H}A^{-1/2}v'_0\|_H
+ \int_0^t \|A^{1/2}s(t-\lambda)\|_{H \rightarrow H}\|A^{-1/2}\nu(\lambda)\|_H d\lambda
\]

\[
\leq \|v_0\|_H + \|A^{-1/2}v'_0\|_H + T \max_{0 \leq t \leq T} \|A^{-1/2}f(t)\|_H.
\]

(1.11)

Applying $A^{1/2}$ to the formula (1.2) and using the estimates (1.10), in a similar manner with (1.10), we obtain

\[
\|A^{1/2}\nu(t)\|_H \leq \|c(t)\|_{H \rightarrow H}A^{1/2}v_0\|_H + \|A^{1/2}s(t)\|_{H \rightarrow H}v'_0\|_H
+ \int_0^t \|A^{1/2}s(t-\lambda)\|_{H \rightarrow H}\|f(\lambda)\|_H d\lambda
\]

\[
\leq \|A^{1/2}v_0\|_H + \|v'_0\|_H + T \max_{0 \leq t \leq T} \|f(t)\|_H.
\]

(1.12)

Now, we obtain the estimate for $\|Av(t)\|_H$. Applying $A$ to the formula (1.2) and using an integration by parts, we can write

\[
Av(t) = c(t)Av_0 + A^{1/2}s(t)A^{1/2}v'_0 + f(T) - c(t)f(0) - \int_0^t c(t-\lambda)f'(\lambda)d\lambda.
\]

(1.13)
Using the last formula and estimates (1.10), we obtain

\[
\|Au(t)\|_H \leq \|c(t)\|_{H^{-H}} \|Av_0\|_H + \|A^{1/2}s(t)\|_{H^{-H}} \|A^{1/2}v_0\|_H \\
+ \|f(T)\|_H + \|c(t)\|_{H^{-H}} \|f(0)\|_H \\
+ \int_0^T \|c(t - \lambda)\|_{H^{-H}} \|f'(\lambda)\|_H d\lambda
\]

(1.14)

Then from the last estimate, it follows that

\[
\max_{0 \leq t \leq T} \|Au(t)\|_H \leq \|Av_0\|_H + \|A^{1/2}v_0\|_H + 2\|f(0)\|_H + 2T \max_{0 \leq s \leq T} \|f'(t)\|_H.
\]

(1.15)

The estimate for \(\max_{0 \leq t \leq T} \|d^2v(t)/dt^2\|_H\) follows from the last estimate and the triangle inequality.

\[\square\]

Remark 1.2. Theorem 1.1 holds in an arbitrary Banach space \(E\) under the following assumptions (see, e.g., [3, 8, 11] and the references given therein):

\[
\|c(t)\|_{E^{-E}} \leq M, \quad \|A^{1/2}s(t)\|_{E^{-E}} \leq M, \quad 0 \leq t \leq T.
\]

Now, we consider the application of this abstract Theorem 1.1. First, we consider the mixed problem for wave equation

\[
\begin{align*}
\frac{\partial u}{\partial t}(t,x) - (a(x)\frac{\partial}{\partial x})_x u(t,x) &= f(t,x), \quad 0 \leq t \leq T, \quad 0 \leq x \leq L, \\
u(0,x) &= \varphi(x), \quad u_t(0,x) = \psi(x), \quad 0 \leq x \leq L, \\
u(t,0) &= \nu_t(t,0) = \nu_x(t,L), \quad 0 \leq t \leq T.
\end{align*}
\]

(1.17)

The problem (1.17) has a unique smooth solution \(u(t,x)\) for the smooth \(a(x) > 0 (x \in [0, L]), \varphi(x), \psi(x) (x \in [0, L]),\) and \(f(t,x) \in [0, T], x \in [0, L])\) functions. This allows us to reduce the mixed problem (1.17) to the initial value problem (1.1) in Hilbert space \(H = L_2[0, L]\) with a selfadjoint positive definite operator \(A\) defined by (1.17). We give a number of corollaries of the abstract Theorem 1.1.

Theorem 1.3. For solutions of the mixed problem (1.17), the stability inequalities

\[
\max_{0 \leq t \leq T} \|u(t, \cdot)\|_{W^1_2[0, L]}
\]

\[
\leq M \left[ \max_{0 \leq s \leq T} \|f(s, \cdot)\|_{L_2[0, L]} + \|\varphi\|_{W^1_2[0, L]} + \|\psi\|_{L_2[0, L]} \right],
\]

\[
\max_{0 \leq t \leq T} \|u(t, \cdot)\|_{W^2_2[0, L]} + \max_{0 \leq t \leq T} \|u_t(t, \cdot)\|_{L_2[0, L]}
\]

\[
\leq M \left[ \max_{0 \leq s \leq T} \|f_t(s, \cdot)\|_{L_2[0, L]} + \|f(0, \cdot)\|_{L_2[0, L]} + \|\varphi\|_{W^2_2[0, L]} + \|\psi\|_{W^2_2[0, L]} \right].
\]

(1.18)

hold, where \(M\) does not depend on \(f(t,x)\) and \(\varphi(x), \psi(x)\).
The proof of this theorem is based on the abstract Theorem 1.1 and the symmetry properties of the space operator generated by the problem (1.17).

Second, let $\Omega \subset \mathbb{R}^n$ be the bounded open domain with smooth boundary $S, \overline{\Omega} = \Omega \cup S$. In $[0, T] \times \overline{\Omega}$ we consider the mixed boundary value problem for hyperbolic equations

\[ u_{tt}(t,x) - \sum_{r=1}^{n} (a_r(x)u_{x_r})_{x_r} = f(t,x), \quad x = (x_1, \ldots, x_n) \in \overline{\Omega}, \quad 0 \leq t \leq T, \]

\[ u(0,x) = \varphi(x), \quad \frac{\partial u(0,x)}{\partial t} = \psi(x), \quad x \in \overline{\Omega}, \]

\[ u(t,x) = 0, \quad x \in S, \quad 0 \leq t \leq T, \]

where $a_r(x) (x \in \overline{\Omega}), \varphi(x), \psi(x) (x \in \overline{\Omega})$, and $f(t,x) (t \in [0,T], x \in \overline{\Omega})$ are given smooth functions and $a_r(x) > 0$.

We introduce the Hilbert space $L_2(\overline{\Omega})$ which is the space of all the integrable functions defined on $\overline{\Omega}$, equipped with the norm

\[ \| f \|_{L_2(\overline{\Omega})} = \left\{ \int_{x \in \overline{\Omega}} |f(x)|^2 \, dx_1 \cdots dx_n \right\}^{1/2}. \]

The problem (1.19) has a unique smooth solution $u(t,x)$ for the smooth $a_r(x) > 0$ and $f(t,x)$ functions. This allows us to reduce the mixed problem (1.19) to the initial value problem (1.1) in Hilbert space $H = L_2(\overline{\Omega})$ with a selfadjoint positive definite operator $A$ defined by (1.19). We give a number of corollaries of the abstract Theorem 1.1.

**Theorem 1.4.** For solutions of the mixed problem (1.19), the stability inequalities

\[
\max_{0 \leq t \leq T} \| u(t, \cdot) \|_{W^2_2(\overline{\Omega})} \leq M \left[ \max_{0 \leq t \leq T} \| f(t, \cdot) \|_{L_2(\overline{\Omega})} + \| \varphi \|_{W^2_2(\overline{\Omega})} + \| \psi \|_{L_2(\overline{\Omega})} \right],
\]

\[
\max_{0 \leq t \leq T} \| u(t, \cdot) \|_{W^2_2(\overline{\Omega})} + \max_{0 \leq t \leq T} \| u_{tt}(t, \cdot) \|_{L_2(\overline{\Omega})} \leq M \left[ \max_{0 \leq t \leq T} \| f(t, \cdot) \|_{L_2(\overline{\Omega})} + \| f(0, \cdot) \|_{L_2(\overline{\Omega})} + \| \varphi \|_{W^2_2(\overline{\Omega})} + \| \psi \|_{W^2_2(\overline{\Omega})} \right],
\]

hold, where $M$ does not depend on $f(t,x)$ and $\varphi(x), \psi(x)$.

The proof of this theorem is based on the abstract Theorem 1.1 and the symmetry properties of the space operator generated by the problem (1.19).
2. The high order of accuracy difference schemes generated by an exact difference scheme

We consider the initial value problem (1.1). On the segment \([0, T]\) we consider a uniform grid

\[
[0, T]_T = \{t_k = k\tau, \ k = 0, 1, \ldots, N, \ N\tau = T\}
\]  \hfill (2.1)

with step \(\tau\). Using the formula (1.2), we can establish the following two-step difference scheme for the solution of the initial value problem (1.1)

\[
v(t_{k+1}) - 2c(\tau)v(t_k) + v(t_{k-1}) = \int_{t_k}^{t_{k+1}} s(t_{k+1} - z) f(z)dz + \int_{t_{k-1}}^{t_k} s(z - t_{k-1}) f(z)dz, \quad 1 \leq k \leq N - 1,
\]

\[
v(0) = v_0,
\]

or

\[
\frac{1}{\tau^2}(u_{k+1} - 2u_k + u_{k-1}) = \frac{2}{\tau^2}(c(\tau) - I)u_k + f_k, \quad f_k = \tau^{-1}\{f_{1,k+1} + s(\tau)f_{2,k} - c(\tau)f_{1,k}\},
\]

\[
f_{1,k} = \tau^{-1}\int_{t_{k-1}}^{t_k} s(t_k - z) f(z)dz, \quad f_{2,k} = \tau^{-1}\int_{t_{k-1}}^{t_k} c(t_k - z) f(z)dz, \quad 1 \leq k \leq N - 1,
\]

\[
u_0 = v_0, \quad u_1 = c(\tau)v(0) + s(\tau)v'(0) + \tau f_{1,1}.
\]  \hfill (2.3)

The latter will be referred to as the exact two-step difference scheme for the initial value problem (1.1).

Suppose the operators \((I - e^{2\tau iB})\) and \((I + e^{\tau iB})\) have the bounded inverses \((I - e^{2\tau iB})^{-1}\) and \((I + e^{\tau iB})^{-1}\). Then this problem is uniquely solvable, and the following formula holds:

\[
u_k = \left[e^{-k\tau iB} - (I - e^{2\tau iB})^{-1}(e^{-k\tau iB} - e^{k\tau iB})\right]u_0 + e^{\tau iB}(I - e^{2\tau iB})^{-1}(e^{-k\tau iB} - e^{k\tau iB})u_1
\]

\[
+ \tau^2 \sum_{m=1}^{k-1} e^{\tau iB}(I - e^{2\tau iB})^{-1}(e^{-(k-m)\tau iB} - e^{(k-m)\tau iB})f_m, \quad 2 \leq k \leq N.
\]  \hfill (2.4)

Actually, (2.3) can be rewritten as the equivalent initial value problem for system of the first-order difference equations:

\[
\tau^{-1}(u_k - u_{k-1}) + \tau^{-1}(I - e^{-\tau iB})u_{k-1} = z_k, \quad 1 \leq k \leq N, \ u_0, u_1 \text{ are given},
\]

\[
\tau^{-1}(z_{k+1} - z_k) + \tau^{-1}(I - e^{\tau iB})z_k = f_k, \quad 1 \leq k \leq N - 1.
\]  \hfill (2.5)
From that, the system of recursion formulas follows:

\[ u_k = e^{-rB} u_{k-1} + \tau z_k, \quad 1 \leq k \leq N, \]

\[ z_{k+1} = e^{rB} z_k + \tau f_k, \quad 1 \leq k \leq N - 1. \]  

(2.6)

Hence

\[ u_k = e^{-rB} u_0 + \sum_{s=1}^{k} e^{-(k-s)rB} \tau z_s, \quad 1 \leq k \leq N, \]

\[ z_k = e^{(k-1)rB} z_1 + \sum_{m=1}^{k-1} e^{(k-1-m)rB} \tau f_m, \quad 2 \leq k \leq N. \]  

(2.7)

From that it follows that

\[ u_1 = e^{-rB} u_0 + \tau z_1, \]

\[ u_k = e^{-rB} u_0 + \sum_{s=2}^{k} e^{-(k-s)rB} \tau z_1 + \sum_{s=2}^{k} e^{-(k-s)rB} \tau \left[ e^{(s-1)rB} z_1 + \sum_{m=1}^{s-1} e^{(s-1-m)rB} \tau f_m \right] \]

\[ = e^{-rB} u_0 + \left[ e^{-(k-1)rB} + \sum_{s=2}^{k} e^{-(k-s)rB} e^{(s-1)rB} \right] \tau z_1 \]

\[ + \sum_{s=2}^{k} e^{-(k-s)rB} \sum_{m=1}^{s-1} e^{(s-1-m)rB} \tau^2 f_m, \quad 2 \leq k \leq N. \]  

(2.8)

Since

\[ e^{-(k-1)rB} + \sum_{s=2}^{k} e^{-(k-s)rB} e^{(s-1)rB} = (I - e^{2rB})^{-1} (e^{-(k-1)rB} - e^{(k+1)rB}) \]

\[ = (I - e^{2rB})^{-1} e^{rB} (e^{-ktrB} - e^{ktrB}), \]

\[ \sum_{s=2}^{k} e^{-(k-s)rB} \sum_{m=1}^{s-1} e^{(s-1-m)rB} \tau^2 f_m = \sum_{m=1}^{k-1} \sum_{s=m+1}^{k} e^{-(k-s)rB} e^{(s-1-m)rB} \tau^2 f_m \]

\[ = \sum_{m=1}^{k-1} (I - e^{2rB})^{-1} e^{rB} (e^{-(k-m)rB} - e^{(k-m)rB}) \tau^2 f_m, \]

(2.9)

we have that

\[ u_k = e^{-rB} u_0 + (I - e^{2rB})^{-1} e^{rB} (e^{-ktrB} - e^{ktrB}) \tau z_1 \]

\[ + \sum_{m=1}^{k-1} (I - e^{2rB})^{-1} e^{rB} (e^{-(k-m)rB} - e^{(k-m)rB}) \tau^2 f_m, \quad 2 \leq k \leq N. \]  

(2.10)

Using this formula and the formula \( \tau z_1 = u_1 - e^{-rB} u_0 \), we can obtain the formula (2.4).

We investigate the stability of the exact two-step difference scheme (2.3).
Theorem 2.1. Suppose the operators \((I - e^{2\tau iB})\) and \((I + e^{\tau iB})\) have the bounded inverses \((I - e^{2\tau iB})^{-1}\) and \((I + e^{\tau iB})^{-1}\). Suppose further that \(u_0 \in D(B^2(I + e^{\tau iB})^{-1})\), \(u_1 - u_0 \in D(B^2(I - e^{2\tau iB})^{-1})\), and \(f_k \in D(B(I - e^{\tau iB})^{-1})\), \(1 \leq k \leq N - 1\). Then for the solution of the exact two-step difference scheme (2.3), the following stability inequalities hold:

\[
\max_{0 \leq k \leq N} \|u_k\|_H 
\leq M \left[ \max_{1 \leq k \leq N-1} \left\| \tau(B(I - e^{2\tau iB})^{-1}f_k) \right\|_H + \left\| B(I - e^{2\tau iB})^{-1}(u_1 - u_0) \right\|_H \right]
\]

\[
\leq M \left[ \max_{1 \leq k \leq N-1} \left\| \tau B(I - e^{2\tau iB})^{-1}f_k \right\|_H + \left\| B(I - e^{2\tau iB})^{-1}(u_1 - u_0) \right\|_H \right]
\]

\[
\leq M \left[ \max_{1 \leq k \leq N-1} \left\| \tau B(I - e^{2\tau iB})^{-1}(f_k - f_{k-1}) \right\|_H + \left\| B(I - e^{2\tau iB})^{-1}f_k \right\|_H + \left\| B^2(I + e^{\tau iB})^{-1}u_0 \right\|_H \right],
\]

where \(M\) does not depend on \(\tau\), \(f_k\), \(1 \leq k \leq N - 1\), and \(u_0, u_1\).

Proof. Using the formula (2.4) and the estimates

\[
\|e^{\pm \tau iB}\|_{H \to H} \leq 1, \quad 1 \leq k \leq N,
\]

we obtain

\[
\|u_k\|_H \leq \|(I + e^{\tau iB})e^{-\tau iB} - (e^{-\tau iB} - e^{\tau iB})\|_{H \to H} \|(I + e^{\tau iB})^{-1}u_0\|_H
\]

\[
+ \|e^{-\tau iB} - e^{\tau iB}\|_{H \to H} \|(I - e^{2\tau iB})^{-1}(u_1 - u_0)\|_H
\]

\[
+ \tau^2 \sum_{m=1}^{k-1} \|e^{\tau iB}(e^{-(k-m)\tau iB} - e^{-(k-m)\tau iB})\|_{H \to H} \|(I - e^{2\tau iB})^{-1}f_m\|_H
\]

\[
\leq M \left[ \max_{1 \leq m \leq N-1} \left\| \tau B(I - e^{2\tau iB})^{-1}f_m \right\|_H + \left\| B(I - e^{2\tau iB})^{-1}(u_1 - u_0) \right\|_H \right]
\]

for \(k \geq 2\). It obviously holds also for \(k = 0, 1\). The estimate (2.11) is established. Applying \(\tau^{-1}(I - e^{-\tau iB})\) to the formula (2.4) and using the estimates (2.14) and

\[
\|\tau^{-1}(I - e^{-\tau iB})B^{-1}\|_{H \to H} \leq 1,
\]

(2.16)
in a similar manner with (2.11), we obtain

\[
\| \tau^{-1}(I - e^{-r_i B}) u_{k-1} \|_H \\
\leq \| \tau^{-1}(I - e^{-r_i B}) B^{-1} \|_{H \rightarrow H} \\
\times \left\{ \| (I + e^{r_i B}) e^{-(k-1)riB} - (e^{-(k-1)riB} - e^{(k-1)riB}) \|_{H \rightarrow H} \| B(I + e^{r_i B})^{-1} u_0 \|_H \\
+ \| e^{-(k-1)riB} - e^{(k-1)riB} \|_{H \rightarrow H} \| B(I - e^{2riB})^{-1} (u_1 - u_0) \|_H \\
+ \tau \sum_{m=1}^{k-2} \| e^{r_i B} (e^{-(k-1-m)riB} - e^{(k-1-m)riB}) \|_{H \rightarrow H} \| \tau B(I - e^{2riB})^{-1} f_m \|_H \right\}
\]

\[
\leq M \left[ \max_{1 \leq m \leq N-1} \| B \tau (I - e^{2riB})^{-1} f_m \|_H + \| B(I - e^{2riB})^{-1} (u_1 - u_0) \|_H + \| B(I + e^{r_i B})^{-1} u_0 \|_H \right]
\]

(2.17)

for \( k \geq 3 \). It obviously holds also for \( k = 1, 2 \). So, we have that

\[
\max_{1 \leq k \leq N} \| \tau^{-1}(I - e^{-r_i B}) u_{k-1} \|_H \leq M \left[ \max_{1 \leq k \leq N-1} \| B \tau (I - e^{2riB})^{-1} f_k \|_H \\
+ \| B(I - e^{2riB})^{-1} (u_1 - u_0) \|_H + \| B(I + e^{r_i B})^{-1} u_0 \|_H \right].
\]

(2.18)

In a similar manner, one can show that

\[
\max_{1 \leq k \leq N} \| \tau^{-1}(u_k - u_{k-1}) \|_H \leq M \left[ \max_{1 \leq k \leq N-1} \| B \tau (I - e^{2riB})^{-1} f_k \|_H \\
+ \| B(I - e^{2riB})^{-1} (u_1 - u_0) \|_H + \| B(I + e^{r_i B})^{-1} u_0 \|_H \right].
\]

(2.19)

The estimate (2.12) is established. Now, we obtain the estimate for \( \| (2/\tau^2)(c(\tau) - I) u_k \|_H \). Applying \((2/\tau^2)(c(\tau) - I) = (1/\tau^2)e^{-r_i B}(I - e^{r_i B})^2\) to the formula (2.4) and using the Abel formula, we can write the formula

\[
\frac{2}{\tau^2}(c(\tau) - I) u_k = \frac{1}{\tau^2} e^{-r_i B}(I - e^{r_i B})^2 \left[ e^{-k\tau_i B} - (I + e^{r_i B})^{-1} (e^{k\tau_i B} - e^{k\tau_i B}) \right] u_0 \\
+ \frac{1}{\tau^2}(I - e^{r_i B})^2 (I - e^{2riB})^{-1} (e^{-k\tau_i B} - e^{k\tau_i B})(u_1 - u_0) \\
+ \frac{1}{\tau}(I - e^{r_i B}) \sum_{m=1}^{k-1} \tau (I - e^{riB})(I - e^{2riB})^{-1} (e^{-(k-m)riB} - e^{(k-m)riB}) f_m
\]
Using the last formula and estimates (2.14) and (2.16), we obtain

$$\frac{2}{\tau^2} \| (c(\tau) - I) u_k \|_H$$

\[
\leq \left\| \frac{1}{\tau} (I - e^{i\tau B}) B^{-1} \right\|_{H \rightarrow H}^2
\times \left\| e^{-i\tau B} \right\|_{H \rightarrow H} \left\| (I + e^{i\tau B}) e^{-k\tau iB} - (e^{-k\tau B} - e^{k\tau IB}) \right\|_{H \rightarrow H}
\times \left\| B^2 (I + e^{i\tau B})^{-1} u_0 \right\|_H + \frac{1}{\tau} \left\| (I - e^{i\tau B}) B^{-1} \right\|_{H \rightarrow H}^2 \left\| e^{-k\tau IB} - e^{k\tau IB} \right\|_{H \rightarrow H}
\times \left\| B^2 (I - e^{2i\tau B})^{-1} (u_1 - u_0) \right\|_H + \left\| \frac{1}{\tau} (I - e^{i\tau B}) B^{-1} \right\|_{H \rightarrow H}^2
\times \sum_{m=1}^{k-1} \tau \left\| (e^{-(k-m)\tau iB} + e^{(k+1-m)\tau iB}) \right\|_{H \rightarrow H} \left\| B (I - e^{2\tau iB})^{-1} (f_m - f_{m-1}) \right\|_H
\times \left\| \frac{1}{\tau} (I - e^{i\tau B}) B^{-1} \right\|_{H \rightarrow H} \left\| e^{-(k-1)\tau iB} + e^{k\tau IB} \right\|_{H \rightarrow H} \left\| \tau B (I - e^{2\tau iB})^{-1} f_1 \right\|_H
\times \left\| \frac{1}{\tau} (I - e^{i\tau B}) B^{-1} \right\|_{H \rightarrow H} \left\| I + e^{i\tau IB} \right\|_{H \rightarrow H} \left\| \tau B (I - e^{2\tau iB})^{-1} f_{k-1} \right\|_H
\leq M \left[ \max_{2 \leq m \leq N-1} \left\| B (I - e^{2\tau iB})^{-1} (f_m - f_{m-1}) \right\|_H + \left\| \tau B (I - e^{2\tau iB})^{-1} f_1 \right\|_H
\times \left\| B^2 (I - e^{2i\tau B})^{-1} (u_1 - u_0) \right\|_H + \left\| B^2 (I + e^{i\tau B})^{-1} u_0 \right\|_H \right]
\]

for \( k \geq 2 \). It obviously holds also for \( k = 1 \). So, we have that

$$\max_{1 \leq k \leq N-1} \left\| \frac{2}{\tau^2} (c(\tau) - I) u_k \right\|_H$$

\[
\leq M \left[ \max_{2 \leq k \leq N-1} \left\| \tau B (I - e^{2\tau iB})^{-1} (f_k - f_{k-1}) \right\|_H + \left\| \tau B (I - e^{2\tau iB})^{-1} f_1 \right\|_H
\times \left\| B^2 (I - e^{2i\tau B})^{-1} (u_1 - u_0) \right\|_H + \left\| B^2 (I + e^{i\tau B})^{-1} u_0 \right\|_H \right].
\] (2.22)

The estimate for \( \max_{1 \leq k \leq N-1} \| \tau^{-2}(u_{k+1} - 2u_k + u_{k-1}) \|_H \) follows from the last estimate and the triangle inequality. \( \square \)
Note that we have not been able to obtain the following stability inequalities:

\[
\max_{0 \leq k \leq N} \| u_k \|_H \leq M \left( \max_{1 \leq k \leq N-1} \| B^{-1} f_k \|_H + \| \tau^{-1} (u_1 - u_0) \|_H + \| u_0 \|_H \right),
\]

\[
\max_{1 \leq k \leq N} \| \tau^{-1} (u_k - u_{k-1}) \|_H + \max_{1 \leq k \leq N} \| \tau^{-1} (I - e^{-\tau iB}) u_{k-1} \|_H \leq M \left( \max_{1 \leq k \leq N-1} \| f_k \|_H + \| B u_0 \|_H + \| \tau^{-1} (u_1 - u_0) \|_H \right),
\]

\[
\max_{1 \leq k \leq N-1} \| \tau^{-2} (u_{k+1} - 2u_k + u_{k-1}) \|_H + \max_{1 \leq k \leq N-1} \left\| \frac{2}{\tau^2} (c(\tau) - I) u_k \right\|_H \leq M \left( \max_{2 \leq k \leq N-1} \| \tau^{-1} (f_k - f_{k-1}) \|_H + \| f_1 \|_H + \| B \tau^{-1} (u_1 - u_0) \|_H + \| B^2 u_0 \|_H \right),
\]

(2.23)

for the solution of the exact two-step difference scheme (2.3). Nevertheless, the following result holds.

**Theorem 2.2.** Suppose the operators \((I - e^{2\tau iB})\) and \((I + e^{\tau iB})\) have the bounded inverses \((I - e^{2\tau iB})^{-1}\) and \((I + e^{\tau iB})^{-1}\). Suppose that \(u_0 \in D(B^3)\), \(u_1 - u_0 \in D(B^2)\), and \(f_k \in D(B)\), \(1 \leq k \leq N - 1\). Then for the solution of the exact two-step difference scheme (2.3), the following stability inequalities hold:

\[
\max_{0 \leq k \leq N} \| u_k \|_H \leq M \left( \max_{1 \leq k \leq N-1} \| f_k \|_H + \| \tau^{-1} (u_1 - u_0) \|_H + \| B u_0 \|_H \right),
\]

(2.24)

\[
\max_{1 \leq k \leq N} \| \tau^{-1} (u_k - u_{k-1}) \|_H + \max_{1 \leq k \leq N} \| \tau^{-1} (I - e^{-\tau iB}) u_{k-1} \|_H \leq M \left( \max_{1 \leq k \leq N-1} \| B f_k \|_H + \| B^2 u_0 \|_H + \| B \tau^{-1} (u_1 - u_0) \|_H \right),
\]

(2.25)

\[
\max_{1 \leq k \leq N-1} \| \tau^{-2} (u_{k+1} - 2u_k + u_{k-1}) \|_H + \max_{1 \leq k \leq N-1} \left\| \frac{2}{\tau^2} (c(\tau) - I) u_k \right\|_H \leq M \left( \max_{2 \leq k \leq N-1} \| \tau^{-1} (f_k - f_{k-1}) \|_H + \| B f_1 \|_H + \| B^2 \tau^{-1} (u_1 - u_0) \|_H + \| B^3 u_0 \|_H \right),
\]

(2.26)

where \(M\) does not depend on \(\tau\), \(f_k\), \(1 \leq k \leq N - 1\), and \(u_0, u_1\).

**Proof.** Using the formula (2.4) and the estimates (2.14), (2.16) and

\[
\left\| \left( I - e^{2\tau iB} \right)^{-1} (e^{-k\tau iB} - e^{k\tau iB}) \right\|_{H \to H} \leq k,
\]

(2.27)
we obtain
\[
\|u_k\|_H \leq \|e^{-k\tau B}\|_{H-H} \|u_0\|_H + \|\tau^{-1}(I - e^{-\tau B})B^{-1}\|_{H-H}
\]
\[
\times \left\{ \|\tau^{-1}(I - e^{-\tau B})B^{-1}\|_{H-H} \|Bu_0\|_H + \|\tau^{-1}(I - e^{-\tau B})B^{-1}\|_{H-H}
\right. \\
\times \left\{ \|I - e^{-\tau B}\|_{H-H} \|B^2u_0\|_H \\
+ \|I - e^{-\tau B}\|_{H-H} \|\tau^{-1}(u_1 - u_0)\|_H \\
+ \tau^2 \sum_{m=1}^{k-2} \|\tau^{m}\|_{H-H} \|I - e^{-\tau B}\|_{H-H} \|\tau^{-1}(u_1 - u_0)\|_H \right\}
\]
\[
\leq M \left[ \max_{1 \leq m \leq N-1} \|Bf_m\|_H + \|\tau^{-1}(u_1 - u_0)\|_H + \|B^2u_0\|_H \right]
\]
(2.28)

for \(k \geq 2\). It obviously holds also for \(k = 0, 1\). The estimate (2.24) is established. Applying \(\tau^{-1}(I - e^{-\tau B})\) to the formula (2.4) and using the estimates (2.14), (2.16), and (2.27) in a similar manner with (2.24), we obtain
\[
\|\tau^{-1}(I - e^{-\tau B})u_{k-1}\|_H
\]
\[
\leq \|\tau^{-1}(I - e^{-\tau B})B^{-1}\|_{H-H}
\]
\[
\times \left\{ \|e^{-(k-1)\tau B}\|_{H-H} \|Bu_0\|_H + \|\tau^{-1}(I - e^{-\tau B})B^{-1}\|_{H-H} \\
\times \left\{ \|I - e^{-\tau B}\|_{H-H} \|B^2u_0\|_H \\
+ \|I - e^{-\tau B}\|_{H-H} \|\tau^{-1}(u_1 - u_0)\|_H \\
+ \tau^2 \sum_{m=1}^{k-2} \|\tau^{m}\|_{H-H} \|I - e^{-\tau B}\|_{H-H} \|\tau^{-1}(u_1 - u_0)\|_H \right\} \\
\leq M \left[ \max_{1 \leq m \leq N-1} \|Bf_m\|_H + \|\tau^{-1}(u_1 - u_0)\|_H + \|B^2u_0\|_H \right]
\]
(2.29)

for \(k \geq 3\). It obviously holds also for \(k = 1, 2\). So, we have that
\[
\max_{1 \leq k \leq N} \|\tau^{-1}(I - e^{-\tau B})u_{k-1}\|_H \leq M \left[ \max_{1 \leq k \leq N-1} \|Bf_k\|_H + \|\tau^{-1}(u_1 - u_0)\|_H + \|B^2u_0\|_H \right].
\]
(2.30)

In a similar manner, one can show that
\[
\max_{1 \leq k \leq N} \|\tau^{-1}(u_k - u_{k-1})\|_H \leq M \left[ \max_{1 \leq k \leq N-1} \|Bf_k\|_H + \|\tau^{-1}(u_1 - u_0)\|_H + \|B^2u_0\|_H \right].
\]
(2.31)
The estimate (2.25) is established. Now, we obtain the estimate for $\| (2/\tau^2)(c(\tau) - I)u_k \|_H$. Using the formula (2.20) and the estimates (2.14), (2.16), and (2.27), we obtain

$$\frac{2}{\tau^2} \| (c(\tau) - I)u_k \|_H$$

\[\leq \left\| \frac{1}{\tau} (I - e^{\tau iB}) B^{-1} \right\|^2_{H \to H} \left\| e^{-\tau iB} \right\|_{H \to H} \]

\[\times \left\| e^{-k\tau iB} \right\|_{H \to H} \times \left\| B^2 u_0 \right\|_H + \left\| \frac{1}{\tau} (I - e^{\tau iB}) B^{-1} \right\|_{H \to H} \]

\[\times \left\| (I - e^{2\tau iB})^{-1} (e^{-k\tau iB} - e^{k\tau iB}) \right\|_{H \to H} \]

\[+ \left\| \frac{1}{\tau} (I - e^{\tau iB}) B^{-1} \right\|^2_{H \to H} \left\| (I - e^{2\tau iB})^{-1} (e^{-k\tau iB} - e^{k\tau iB}) \right\|_{H \to H} \left\| B^2 (u_1 - u_0) \right\|_H \]

\[+ \left\| \frac{1}{\tau} (I - e^{\tau iB}) B^{-1} \right\|_{H \to H} \sum_{m=1}^{k-1} \tau \left\| (I - e^{2\tau iB})^{-1} (e^{-(k-m)\tau iB} - e^{(k-m)\tau iB}) \right\|_{H \to H} \]

\[\times \left\| B (f_m - f_{m-1}) \right\|_H + \sum_{m=1}^{k-1} \left\| (I - e^{\tau iB}) (I - e^{2\tau iB})^{-1} (e^{(k-m)\tau iB} + e^{(k+1-m)\tau iB}) \right\|_{H \to H} \]

\[\times \left\| (f_m - f_{m-1}) \right\|_H + \frac{1}{\tau} \left\| (I - e^{\tau iB}) B^{-1} \right\|_{H \to H} \]

\[\times \left\| (I - e^{2\tau iB})^{-1} [e^{-(k-1)\tau iB} - e^{(k-1)\tau iB}] \right\|_{H \to H} \]

\[\times \left\| \tau B f_i \right\|_H + \left\| (I - e^{\tau iB}) (I - e^{2\tau iB})^{-1} [e^{(k-1)\tau iB} + e^{k\tau iB}] \right\|_{H \to H} \left\| f_i \right\|_H \]

\[+ \left\| (I - e^{\tau iB}) (I - e^{2\tau iB})^{-1} [I + e^{\tau iB}] \right\|_{H \to H} \left\| f_{k-1} \right\|_H \]

\[\leq M \left[ \max_{2 \leq m \leq N-1} \left\| B \tau^{-1} (f_m - f_{m-1}) \right\|_H + \max_{2 \leq m \leq N-1} \left\| \tau^{-1} (f_m - f_{m-1}) \right\|_H \]

\[+ \left\| B f_i \right\|_H + \left\| f_i \right\|_H + \left\| B^2 \tau^{-1} (u_1 - u_0) \right\|_H + \left\| B^3 u_0 \right\|_H \right] \]

\[\leq M \left[ \max_{2 \leq m \leq N-1} \left\| B \tau^{-1} (f_m - f_{m-1}) \right\|_H + \left\| B f_i \right\|_H + \left\| B^2 \tau^{-1} (u_1 - u_0) \right\|_H + \left\| B^3 u_0 \right\|_H \right] \]

(2.32)

for $k \geq 2$. It obviously holds also for $k = 1$. So, we have that

$$\max_{1 \leq k \leq N-1} \frac{2}{\tau^2} \| (c(\tau) - I)u_k \|_H$$

\[\leq M \left[ \max_{2 \leq k \leq N-1} \left\| B \tau^{-1} (f_k - f_{k-1}) \right\|_H + \left\| B f_i \right\|_H + \left\| B^2 \tau^{-1} (u_1 - u_0) \right\|_H + \left\| B^3 u_0 \right\|_H \right]. \]

(2.33)

The estimate for $\max_{1 \leq k \leq N-1} \left\| \tau^{-2} (u_k+1 - 2u_k + u_{k-1}) \right\|_H$ follows from the last estimate and the triangle inequality. \qed
Remark 2.3. Theorem 2.1 actually holds in an arbitrary Banach space $E$ under the following assumptions:

$$
\|e^{z k \tau B}\|_{E^{-E}} \leq M, \quad 1 \leq k \leq N,
$$

(2.34)

where $M$ does not depend on $\tau$.

Remark 2.4. This approach permits us to construct the high order of accuracy two-step uniform difference schemes for differential equations of the hyperbolic type with an arbitrary parameter $\varepsilon$ on the highest derivative. In [2, 3] the stability estimates of the solutions of the high order of accuracy difference schemes for hyperbolic equations with an arbitrary $\varepsilon$ parameter on the highest derivative were obtained.

Now, we will consider the applications of the exact difference scheme (2.3). From (2.3) it is clear that for the approximate solutions of the problem (1.1), it is necessary to approximate the expressions

$$
\int_{t_{k-1}}^{t_k} s(t_k - z) f(z) dz, \quad \int_{t_{k-1}}^{t_k} c(t_k - z) f(z) dz.
$$

(2.35)

We remark that in constructing difference schemes, it is important to know how to construct $f_{k}^{j,l}$ and $f_{1,1}^{j,l}$ such that

$$
\tau^{-2} \int_{t_k}^{t_{k+1}} s(t_{k+1} - z) f(z) dz - c(\tau) \tau^{-2} \int_{t_{k-1}}^{t_k} s(t_k - z) f(z) dz
$$

$$
+ s(\tau) \tau^{-2} \int_{t_{k-1}}^{t_k} c(t_k - z) f(z) dz - f_{k}^{j,l} = o(\tau^{j+l}),
$$

(2.36)

and the formulas of $f_{k}^{j,l}$ and $f_{1,1}^{j,l}$ are sufficiently simple. The choice of $f_{k}^{j,l}$ and $f_{1,1}^{j,l}$ is not unique. Using Taylor’s formula and integration by parts, we obtain the representation

$$
\tau^{-2} \int_{t_{k-1}}^{t_k} s(t_k - z) f(z) dz
$$

$$
= \sum_{m=0}^{j+l-1} \beta_m f^{(m)}(t_{k-1}) + \tau^{-2} \int_{t_{k-1}}^{t_k} s(t_k - z) \int_{t_{k-1}}^{s} \frac{(s-z)^{j+l-1}}{(j+l-1)!} f^{(j+l)}(z) dz ds,
$$

(2.37)

in which

$$
\beta_m = -A^{-1} \frac{\tau^{m-2}}{m!} + A^{-1} \beta_{m-2}, \quad 2 \leq m \leq j + l - 1,
$$

$$
\beta_0 = \tau^{-2} A^{-1} (c(\tau) - I), \quad \beta_1 = \tau^{-2} A^{-1} (s(\tau) - \tau I).
$$

(2.38)
In a similar manner, one can obtain that
\[
\tau^{-2} \int_{t_{k-1}}^{t_k} c(t_k - z) f(z) dz \\
= \sum_{m=0}^{j+l-1} y_m f^{(m)}(t_{k-1}) + \tau^{-2} \int_{t_{k-1}}^{t_k} c(t_k - z) \int_{t_{k-1}}^{s} \frac{(s-z)^{j+l-1}}{(j+l-1)!} f^{(j+l)}(z) dz ds,
\] (2.39)
in which
\[
y_m = \beta_{m-1}, \quad 1 \leq m \leq j + l - 1, \quad y_0 = \tau^{-2} s(\tau). \tag{2.40}
\]
Using the definitions of \(s(\tau)\) and \(c(\tau)\) and Pade fractions for the function \(e^{-z}\) (see [1]), we can write
\[
c(\tau) = \frac{R_{j,l+1}(i\tau B) + R_{j,l+1}(-i\tau B)}{2} + o(\tau^{j+l+2}), \tag{2.41}
\]
\[
s(\tau) = B^{-1} \frac{R_{j,l+1}(i\tau B) - R_{j,l+1}(-i\tau B)}{2i} + o(\tau^{j+l+2}).
\]
Now, using the formulas (2.36), (2.37), (2.39), and (2.41), \(f_k^{j,l}\) and \(f_{1,1}^{j,l}\) can be defined by the following formulas:
\[
f_k^{j,l} = \sum_{m=0}^{j+l-1} B_m f^{(m)}(t_k) + B^{-1} \frac{R_{j,l+1}(i\tau B) - R_{j,l+1}(-i\tau B)}{2i} \sum_{m=0}^{j+l-1} \tilde{B}_m f^{(m)}(t_{k-1}) \\
- \frac{R_{j,l+1}(i\tau B) + R_{j,l+1}(-i\tau B)}{2} \sum_{m=0}^{j+l-1} B_m f^{(m)}(t_{k-1}), \tag{2.42}
\]
\[
f_{1,1}^{j,l} = \sum_{m=0}^{j+l-2} \tilde{B}_m f^{(m)}(0), \quad f_0^{j,l} = \tau f_{1,1}^{j,l},
\]
where
\[
B_m = -A^{-1} \frac{\tau^{m-2}}{m!} + A^{-1} B_{m-2}, \quad 2 \leq m \leq j + l - 1,
\]
\[
B_0 = \tau^{-2} A^{-1} \left( \frac{R_{j,l+1}(i\tau B) + R_{j,l+1}(-i\tau B)}{2} - I \right),
\]
\[
B_1 = \tau^{-2} A^{-1} \left( B^{-1} \frac{R_{j,l+1}(i\tau B) - R_{j,l+1}(-i\tau B)}{2i} - \tau I \right), \tag{2.43}
\]
\[
\tilde{B}_m = B_{m-1}, \quad 1 \leq m \leq j + l - 1,
\]
\[
\tilde{B}_0 = \tau^{-2} B^{-1} \frac{R_{j,l+1}(i\tau B) - R_{j,l+1}(-i\tau B)}{2i}.
\]
functions and the following formula holds:

\[ \tau^{-2}(u_{k+1} - 2u_k + u_{k-1}) + \tilde{A}u_k = f_k^j, \quad 1 \leq k \leq N-1, \quad u_0 = v_0, \]

\[ \tilde{A} = 2\tau^{-2}\left( I - \frac{R_{j,l+1}(i\tau B) + R_{j,l+1}(-i\tau B)}{2} \right), \]

\[ \tau^{-1}(u_1 - u_0) = \tau^{-1}\left( \frac{R_{j,l}(i\tau B) + R_{j,l}(-i\tau B)}{2} - I \right)v_0 \]

\[ + \tau^{-1}B^{-1}\frac{R_{j,l}(i\tau B) - R_{j,l}(-i\tau B)}{2i}v'(0) + f_0^j \]

for the approximate solution of the initial value problem (1.1).

Now, using the formulas (2.41), (2.42), and (2.37), we obtain the difference schemes (j + l)th order of accuracy

\[ \tau^{-2}(u_{k+1} - 2u_k + u_{k-1}) + \tilde{A}u_k = f_k^j, \quad 1 \leq k \leq N-1, \quad u_0 = v_0, \]

\[ \tilde{A} = 2\tau^{-2}\left( I - \frac{R_{j,l+1}(i\tau B) + R_{j,l+1}(-i\tau B)}{2} \right), \]

\[ \tau^{-1}(u_1 - u_0) = \tau^{-1}\left( \frac{R_{j,l}(i\tau B) + R_{j,l}(-i\tau B)}{2} - I \right)v_0 \]

\[ + \tau^{-1}B^{-1}\frac{R_{j,l}(i\tau B) - R_{j,l}(-i\tau B)}{2i}v'(0) + f_0^j \]

Note that the difference schemes (2.44) for \( j = l, j = l - 1, \) and \( j = l + 1 \) include difference schemes of arbitrary high order of approximation. Moreover, the corresponding functions \( |R_{j,l+1}(z)| \) tend to 0 as \( z \to \infty \) for \( j = l - 1, l \) and \( |R_{j,l+1}(z)| = 1 \) for \( j = l + 1. \) Such difference schemes are simplest, in the sense that the degrees of the denominators of the corresponding Pade approximants of the function \( \exp\{-z\} \) are minimal for a fixed order of approximation of the difference schemes.

Suppose the operators \( (I - R_{j,l}^2(i\tau B)) \) and \( (I + R_{j,l}(i\tau B)) \) have the bounded inverses \( (I - R_{j,l}^2(i\tau B))^{-1} \) and \( (I + R_{j,l}(i\tau B))^{-1}. \) It is clear that this problem is uniquely solvable, and the following formula holds:

\[ u_k = \left[ R_{j,l}^k(-i\tau B) - (I - R_{j,l}^2(i\tau B))^{-1}(R_{j,l}^k(-i\tau B) - R_{j,l}^k(i\tau B)) \right]u_0 \]

\[ + R_{j,l}(i\tau B)(I - R_{j,l}^2(i\tau B))^{-1}(R_{j,l}^k(-i\tau B) - R_{j,l}^k(i\tau B))u_1 \]

\[ + \tau^2 \sum_{m=1}^{k-1} R_{j,l}(i\tau B)(I - R_{j,l}^2(i\tau B))^{-1}(R_{j,l}^{k-m}(-i\tau B) - R_{j,l}^{k-m}(i\tau B))f_m^j, \quad 2 \leq k \leq N, \]

\[ u_1 = \frac{R_{j,l}(i\tau B) + R_{j,l}(-i\tau B)}{2}v_0 + B^{-1} \frac{R_{j,l}(i\tau B) - R_{j,l}(-i\tau B)}{2i}v'(0) + \tau f_0^j, \]

\[ u_0 = v_0. \]

(2.45)

We investigate the stability of the exact two-step difference scheme (2.45).

**Theorem 2.5.** Suppose the operators \( (I - R_{j,l}^2(i\tau B)) \) and \( (I + R_{j,l}(i\tau B)) \) have the bounded inverses \( (I - R_{j,l}^2(i\tau B))^{-1} \) and \( (I + R_{j,l}(i\tau B))^{-1}. \) Suppose that \( u_0 \in D(B^2), u_1 - u_0 \in D(B). \) Then for the solution of the two-step difference scheme (2.45) for \( j = l \) and \( j = l - 1, \) the
following stability inequalities hold:

\[
\max_{0 \leq k \leq N} \|u_k\|_H \leq M \left[ \max_{1 \leq k \leq N-1} \|B^{-1} f^{j,l}_k\|_H + \|B^{-1} \tau^{-1}(u_1 - u_0)\|_H + \|u_0\|_H \right],
\]

\[
\max_{1 \leq k \leq N} \|\tau^{-1}(u_k - u_{k-1})\|_H + \max_{1 \leq k \leq N} \|\tau^{-1}(I - e^{-\tau B}) u_{k-1}\|_H 
\leq M \left[ \max_{1 \leq k \leq N-1} \|f^{j,l}_k\|_H + \|\tau^{-1}(u_1 - u_0)\|_H + \|Bu_0\|_H \right],
\]

\[
\max_{1 \leq k \leq N-1} \|\tau^{-2}(u_{k+1} - 2u_k + u_{k-1})\|_H + \max_{1 \leq k \leq N-1} \|\tilde{A} u_k\|_H 
\leq M \left[ \max_{2 \leq k \leq N-1} \|\tau^{-1}(f^{j,l}_k - f^{j,l}_{k-1})\|_H + \|f^{j,l}_1\|_H + \|B\tau^{-1}(u_1 - u_0)\|_H + \|B^2 u_0\|_H \right],
\]

(2.46)

where \(M\) does not depend on \(\tau, f^{j,l}_k, 1 \leq k \leq N - 1, \text{ and } u_0, u_1\).

The proof of Theorem 2.5 follows the scheme of the proof of Theorem 2.1, and relies on the formula (2.45) and on the estimates

\[
\|R_{j,l+1}(\pm \tau B)\|_{H^{-H}} \leq 1,
\]

(2.47)

\[
\|\tau B (I - R^2_{j,l+1}(\tau B))^{-1} R_{j,l+1}(\tau B)\|_{H^{-H}} \leq M.
\]

(2.48)

Note that the estimate (2.48) is not satisfied for \(j = l + 1\). Therefore we have not been able to obtain the same stability inequalities for the solution of the exact two-step difference scheme (2.45) for \(j = l + 1\). Nevertheless, the following result holds.

**Theorem 2.6.** Suppose the operators \((I - R^2_{j,l}(\tau B))\) and \((I + R_{j,l}(\tau B))\) have the bounded inverses \((I - R^2_{j,l}(\tau B))^{-1}\) and \((I + R_{j,l}(\tau B))^{-1}\). Suppose that \(u_0 \in D(B^3), u_1 - u_0 \in D(B^2),\) and \(f^{j,l}_k \in D(B), 1 \leq k \leq N - 1\). Then for the solution of the two-step difference scheme (2.45) for \(j = l + 1\), the following stability inequalities hold:

\[
\max_{0 \leq k \leq N} \|u_k\|_H \leq M \left[ \max_{1 \leq k \leq N-1} \|f^{j,l}_k\|_H + \|\tau^{-1}(u_1 - u_0)\|_H + \|Bu_0\|_H \right],
\]

\[
\max_{1 \leq k \leq N} \|\tau^{-1}(u_k - u_{k-1})\|_H + \max_{1 \leq k \leq N} \|\tau^{-1}(I - e^{-\tau B}) u_{k-1}\|_H 
\leq M \left[ \max_{1 \leq k \leq N-1} \|Bf^{j,l}_k\|_H + \|B\tau^{-1}(u_1 - u_0)\|_H + \|B^2 u_0\|_H \right],
\]

\[
\max_{1 \leq k \leq N-1} \|\tau^{-2}(u_{k+1} - 2u_k + u_{k-1})\|_H + \max_{1 \leq k \leq N-1} \|\tilde{A} u_k\|_H 
\leq M \left[ \max_{2 \leq k \leq N-1} \|\tau^{-1} B(f^{j,l}_k - f^{j,l}_{k-1})\|_H + \|Bf^{j,l}_1\|_H + \|B^2 \tau^{-1}(u_1 - u_0)\|_H + \|B^3 u_0\|_H \right],
\]

(2.49)

where \(M\) does not depend on \(\tau, f^{j,l}_k, 1 \leq k \leq N - 1, \text{ and } u_0, u_1\).
The proof of Theorem 2.6 follows the scheme of the proof of Theorem 2.2, and relies on the formula (2.45), the estimates (2.48), and

\[
\left\| (I - R_{j,l+1}(2i\tau B))^{-1}(R_{j,l+1}^k(-i\tau B) - R_{j,l+1}^k(i\tau B)) \right\|_{H \to H} \leq k. \tag{2.50}
\]

Remark 2.7. Theorem 2.6 actually holds in an arbitrary Banach space \( E \) under the following assumptions:

\[
\left\| R_{j,l+1}^k(\pm i\tau B) \right\|_{E \to E} \leq M, \quad 1 \leq k \leq N, \tag{2.51}
\]

where \( M \) does not depend on \( \tau \).

Now, the abstract Theorems 2.5 and 2.6 are applied in the investigation of difference schemes of higher order of accuracy with respect to one variable for approximate solutions of the mixed boundary value problem (1.19). The discretization of problem (1.19) is carried out in two steps. In the first step we define the grid sets

\[
\tilde{\Omega}_h = \{ x = x_m = (h_1m_1, \ldots, h_nm_n), \ m = (m_1, \ldots, m_n), \ 0 \leq m_r \leq N_r, \ h_rN_r = L, \ r = 1, \ldots, n \}, \quad \Omega_h = \tilde{\Omega}_h \cap \Omega, \quad S_h = \tilde{\Omega}_h \cap S. \tag{2.52}
\]

We introduce the Banach space \( L^2(\tilde{\Omega}_h) \) of the grid functions \( \varphi^h(x) = \{ \varphi(h_1m_1, \ldots, h_nm_n) \} \) defined on \( \tilde{\Omega}_h \), equipped with the norm

\[
\left\| \varphi^h \right\|_{L^2(\tilde{\Omega}_h)} = \left( \sum_{x \in \tilde{\Omega}_h} | \varphi^h(x) |^2 h_1 \cdots h_n \right)^{1/2}. \tag{2.53}
\]

To the differential operator \( A^x \) generated by the problem (1.19), we assign the difference operator \( A^x_h \) by the formula

\[
A^x_h u^h = - \sum_{r=1}^{n} \left( a_r(x)u^h_{x_j} \right)_{x_1, \ldots, x_r} \tag{2.54}
\]

acting in the space of grid functions \( u^h(x) \), and satisfying the conditions \( u^h(x) = 0 \) for all \( x \in S_h \). It is known that \( A^x_h \) is a selfadjoint positive definite operator in \( L^2(\tilde{\Omega}_h) \). With the help of \( A^x_h \), we arrive at the initial value problem

\[
\frac{d^2 v^h(t,x)}{dt^2} + A^x_h v^h(t,x) = f^h(t,x), \quad 0 \leq t \leq T, \ x \in \tilde{\Omega}_h, \tag{2.55}
\]

\[
v^h(0,x) = \varphi^h(x), \quad \frac{dv^h(0,x)}{dt} = \psi^h(x), \quad x \in \tilde{\Omega}_h,
\]

for an infinite system of ordinary differential equations.
Theorem 2.8. Let $\tau$ and $|h|$ be sufficiently small numbers. Then the solutions of the difference schemes (2.56) for $j = l$ and $j = l - 1$ satisfy the following stability estimates:

$$\max_{0 \leq k \leq N} \left\| u_k^h \right\|_{L^2(\tilde{\Omega}_h)}$$

$$\leq M_1 \left[ \max_{0 \leq k \leq N - 1} \left\| (B_h^x)^{-1} f_k^h \right\|_{L^2(\tilde{\Omega}_h)} + \left\| (B_h^x)^{-1} \psi^h \right\|_{L^2(\tilde{\Omega}_h)} + \left\| \varphi^h \right\|_{L^2(\tilde{\Omega}_h)} \right],$$

where

$$B_m = -(A_h^{\tilde{x}})^{-1} \frac{\tau^{m-2}}{m!} + (A_h^{\tilde{x}})^{-1} B_{m-2}, \quad 2 \leq m \leq j + l - 1,$$

$$B_0 = \tau^{-2} (A_h^{\tilde{x}})^{-1} \left( \frac{R_{j,l+1}(i\tau B_h^x) + R_{j,l+1}(-i\tau B_h^x)}{2} - I \right),$$

$$B_1 = \tau^{-2} (A_h^{\tilde{x}})^{-1} \left( \frac{(B_h^x)^{-1} R_{j,l+1}(i\tau B_h^x) - R_{j,l+1}(-i\tau B_h^x)}{2i} \right),$$

$$\tilde{B}_m = B_{m-1}, \quad 1 \leq m \leq j + l - 1,$$

$$\tilde{B}_0 = \tau^{-2} (B_h^x)^{-1} \frac{R_{j,l+1}(i\tau B_h^x) - R_{j,l+1}(-i\tau B_h^x)}{2i}.$$
Here $M_1$ does not depend on $\tau$, $h$, $\phi^h(x)$, $\psi^h(x)$, and $f_k^h(x)$, $0 \leq k \leq N - 1$.

The proof of Theorem 2.9 is based on the abstract Theorem 2.2, and the symmetry properties of the difference operator $A^h_{ik}$ defined by the formula (2.56).

**Theorem 2.9.** Let $\tau$ and $|h|$ be sufficiently small numbers. Then the solutions of the difference schemes (2.56) for $j = l + 1$ satisfy the following stability estimates:

\[
\max_{0 \leq k \leq N} \left\| u_k^h \right\|_{L_2(\tilde{\Omega}_h)} \leq M_1 \left[ \max_{0 \leq k \leq N-1} \left\| f_k^h \right\|_{L_2(\tilde{\Omega}_h)} + \left\| \psi^h \right\|_{L_2(\tilde{\Omega}_h)} + \sum_{r=1}^{n} \left\| \phi^{h}_{k,r,m_{r}} \right\|_{L_2(\tilde{\Omega}_h)} \right],
\]

\[
\max_{1 \leq k \leq N} \left\| \tau^{-1} (u_k^h - u_{k-1}^h) \right\|_{L_2(\tilde{\Omega}_h)} \leq M_1 \left[ \max_{0 \leq k \leq N-1} \left\| f_k^h \right\|_{L_2(\tilde{\Omega}_h)} + \left\| \psi^h \right\|_{L_2(\tilde{\Omega}_h)} + \sum_{r=1}^{n} \left\| \phi^{h}_{k,r,m_{r}} \right\|_{L_2(\tilde{\Omega}_h)} \right],
\]

\[
\max_{1 \leq k \leq N-1} \left\| \tau^{-2} (u_{k+1}^h - 2u_k^h + u_{k-1}^h) \right\|_{L_2(\tilde{\Omega}_h)} \leq M_1 \left[ \max_{0 \leq k \leq N-1} \sum_{r=1}^{n} \left\| (f_k^h)_{x_r,m_r} \right\|_{L_2(\tilde{\Omega}_h)} + \sum_{r=1}^{n} \left\| \psi^h_{x_r,m_r} \right\|_{L_2(\tilde{\Omega}_h)} + \sum_{r=1}^{n} \left\| \phi^{h}_{k,r,m_{r}} \right\|_{L_2(\tilde{\Omega}_h)} \right],
\]

\[
\max_{1 \leq k \leq N-1} \left\| \tau^{-2} (u_{k+1}^h - 2u_k^h + u_{k-1}^h) \right\|_{L_2(\tilde{\Omega}_h)} \leq M_1 \left[ \max_{0 \leq k \leq N-1} \sum_{r=1}^{n} \left\| (f_k^h)_{x_r,m_r} \right\|_{L_2(\tilde{\Omega}_h)} + \sum_{r=1}^{n} \left\| (f_k^h)_{x_r,m_r} \right\|_{L_2(\tilde{\Omega}_h)} + \sum_{r=1}^{n} \left\| \phi^{h}_{k,r,m_{r}} \right\|_{L_2(\tilde{\Omega}_h)} \right].
\]

Here $M_1$ does not depend on $\tau$, $h$, $\phi^h(x)$, $\psi^h(x)$, and $f_k^h(x)$, $0 \leq k \leq N - 1$.

The proof of Theorem 2.9 is based on the abstract Theorem 2.5, and the symmetry properties of the difference operator $A^h_{ik}$ defined by the formula (2.56).

Note that in a similar manner one can construct the difference schemes of a high order of accuracy with respect to one variable for approximate solutions of the boundary value problem (1.17). Abstract Theorems 2.2 and 2.5 permit us to obtain the stability estimates for the solutions of these difference schemes.
3. The high order of accuracy difference schemes generated by Taylor’s decomposition of function on the three points

We consider again the initial value problem (1.1). For the construction of the two-step difference schemes of an arbitrary high order of accuracy for the approximate solutions of the initial value problem (1.1), we consider again a uniform grid space

\[ [0, T]_τ = \{ t_k = kτ, k = 0, 1, \ldots, N, Nτ = T \}. \] (3.1)

The function \( v(t) \) \((0 \leq t \leq T)\) has a \((2l + 2j + 2)\)th continuous derivative and \( t_{k-1}, t_k, t_{k+1} \in [0, T]_τ \). Then we have the following Taylor decomposition on the three points (see [6]):

\[
v(t_{k+1}) - 2v(t_k) + v(t_{k-1}) - \sum_{s=1}^{l} \alpha_s v^{(2s)}(t_k) τ^{2s} - \sum_{s=1}^{j} \eta_s (v^{(2s)}(t_{k-1}) + v^{(2s)}(t_{k+1})) τ^{2s} = o(τ^{2l+2j+2}),
\] (3.2)

where \( η_m, m = 1, \ldots, j \), is the solution of system

\[
η_s = \frac{1}{(2s)!} - \sum_{m=1}^{s-1} \frac{η_m}{(2s-2m)!} \quad \text{for any } s, l + 1 \leq s \leq j,
\]

\[
\sum_{m=1}^{j} \frac{(2s)!η_m}{(2s-2m)!} = 1 \quad \text{for any } s, j + 1 \leq s \leq l + j,
\] (3.3)

\[
α_1 = 1 - 2η_1, \quad α_s = \left( \frac{1}{(2s)!} - η_s - \sum_{m=1}^{s-1} \frac{η_m}{(2s-2m)!} \right) 2 \quad \text{for any } s, 2 \leq s \leq l.
\]

Suppose further that the function \( v(t) \) \((0 \leq t \leq T)\) has a \((2l + 2j + 1)\)th continuous derivative. Then we have the following Taylor decomposition on the two points (see [6]):

\[
v(τ) - v(0) + \sum_{s=1}^{2j} δ_s v^{(s)}(τ) τ^s - \sum_{s=1}^{2l} ρ_s v^{(s)}(0) τ^s = o(τ^{2l+2j+1}),
\] (3.4)

where

\[
ρ_s = \frac{(2l + 2j - s)!(2l)!}{(2l + 2j)!s!(2l - s)!} \quad \text{for any } s, 1 \leq s \leq 2l,
\]

\[
δ_s = \frac{(2l + 2j - s)!(2j)!(-1)^s}{(2l + 2j)!s!(2j - s)!} \quad \text{for any } s, 1 \leq s \leq 2j.
\] (3.5)

Now, we will consider the applications of the Taylor decomposition (3.2) of function \( v(t) \) on the three points and Taylor’s decomposition (3.4) of function \( v(t) \) on the two points to approximate solutions of the initial value problem (1.1). From (3.2) and (3.4) it is clear that for the approximate solution of the problem (1.1), it is necessary to find \( v^{(s)}(τ) \) for any \( s, 1 \leq s \leq 2l \), \( v^{(2s)}(t_k) \) for any \( s, 1 \leq s \leq l \), and \( v^{(2s)}(t_{k-1}), v^{(2s)}(t_{k+1}) \)
for any \( s, 1 \leq s \leq j \). Using the equation

\[
v''(t) = -Av(t) + f(t), \tag{3.6}
\]

we obtain

\[
v^{(2n)}(t) = (-A)^n v(t) + \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-2)}(t), \quad n = 2, \ldots, \tag{3.7}
\]

\[
v^{(2n+1)}(t) = (-A)^n v'(t) + \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-1)}(t), \quad n = 1, \ldots. \tag{3.8}
\]

Suppose further that the function \( v(t) \) \((0 \leq t \leq T)\) has a \((2l + 2j - 2m + 2)\)th continuous derivative. Then by Theorem 1.3, we have the following Taylor decomposition on the two points:

\[
v(\tau) - v(0) + \sum_{s=1}^{2l-2[m/2]} a_s v^{(s)}(\tau) \tau^s - \sum_{s=1}^{2j-2m+2[m/2]+1} b_s v^{(s)}(0) \tau^s = o(\tau^{2l+2j-2m+2}), \tag{3.9}
\]

where

\[
a_s = \frac{(2l + 2j - 2m + 1 - s)!(2l - 2[m/2])!(1-s)!}{(2l + 2j + 1 - 2m)!(p - 2[m/2] - s)!} \quad \text{for any } s, 1 \leq s \leq 2l - 2 \left[ \frac{m}{2} \right],
\]

\[
b_s = \frac{(2l + 2j + 1 - 2m-s)!(2j - 2m + 2[m/2] + 1)!}{(2l + 2j + 1 - 2m)!(2j - 2m + 2[m/2] + 1-s)!} \quad \text{for any } s, 1 \leq s \leq 2j - 2m + 2 \left[ \frac{m}{2} \right] + 1,
\]

\[
\text{where } [a] \text{ denotes the integer part of the number } a. \quad \text{Further using the formulas (3.7), (3.8), and (3.9), we can write}
\]

\[
v'(\tau) - v'(0) + \sum_{n=1}^{1-[m/2]} a_{2n} (-A)^n v'(\tau) \tau^{2n} + \sum_{n=1}^{1-[m/2]} a_{2n} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-1)}(\tau) \tau^{2n}
\]

\[
+ \sum_{n=1}^{1-[m/2]} a_{2n-1} (-A)^n v(\tau) \tau^{2n-1} + \sum_{n=1}^{1-[m/2]} a_{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-2)}(\tau) \tau^{2n-1}
\]

\[
- \sum_{n=1}^{j-[m/2]} b_{2n} (-A)^n v'(0) \tau^{2n} - \sum_{n=1}^{j-[m/2]} b_{2n} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-1)}(0) \tau^{2n}
\]

\[
- \sum_{n=1}^{j-[m/2]+1} b_{2n-1} (-A)^n v(0) \tau^{2n-1} - \sum_{n=1}^{j-[m/2]+1} b_{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-2)}(0) \tau^{2n-1}
\]

\[
= o(\tau^{2l+2j-2m+2}), \quad 0 \leq m \leq j - 1.
\]

\[
\text{(3.11)}
\]
From the last formula it follows that

\[
I + \sum_{n=1}^{l-[m/2]} a_{2n}(-A)^n \tau^{2n} \bigg) v'(\tau) =
\]

\[
= \left(I + \sum_{n=1}^{j-m+[m/2]} b_{2n}(-A)^n \tau^{2n} \bigg) v'(0) - \sum_{n=1}^{l-[m/2]} a_{2n-1}(-A)^n v(\tau) \tau^{2n-1}
\]

\[
+ \sum_{n=1}^{j-m+[m/2]+1} b_{2n-1}(-A)^n v(0) \tau^{2n-1} - \sum_{n=1}^{l-[m/2]} a_{2n} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-1)(\tau) \tau^{2n}
\]

\[
- \sum_{n=1}^{l-[m/2]} a_{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-2)(\tau) \tau^{2n-1} + \sum_{n=1}^{j-m+[m/2]} b_{2n} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-1)(0) \tau^{2n}
\]

\[
+ \sum_{n=1}^{j-m+[m/2]+1} b_{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-2)(0) \tau^{2n-1} + o(\tau^{2l+2j-2m+2}), \quad 0 \leq m \leq j - 1.
\]

(3.12)

Suppose further that the operator \((I + \sum_{n=1}^{l-[m/2]} a_{2n}(-A)^n \tau^{2n})\) has a bounded inverse. Then

\[
v'(\tau) = \left(I + \sum_{n=1}^{l-[m/2]} a_{2n}(-A)^n \tau^{2n} \bigg) v'(0) - \sum_{n=1}^{l-[m/2]} a_{2n-1}(-A)^n v(\tau) \tau^{2n-1}
\]

\[
\times \left\{ \left(I + \sum_{n=1}^{j-m+[m/2]} b_{2n}(-A)^n \tau^{2n} \bigg) v'(0) - \sum_{n=1}^{l-[m/2]} a_{2n-1}(-A)^n v(\tau) \tau^{2n-1}
\]

\[
+ \sum_{n=1}^{j-m+[m/2]+1} b_{2n-1}(-A)^n v(0) \tau^{2n-1} - \sum_{n=1}^{l-[m/2]} a_{2n} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-1)(\tau) \tau^{2n}
\]

\[
- \sum_{n=1}^{l-[m/2]} a_{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-2)(\tau) \tau^{2n-1} + \sum_{n=1}^{j-m+[m/2]} b_{2n} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-1)(0) \tau^{2n}
\]

\[
+ \sum_{n=1}^{j-m+[m/2]+1} b_{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f(2\lambda-2)(0) \tau^{2n-1} \right\}
\]

\[
+ o(\tau^{2l+2j-2m+2}), \quad 0 \leq m \leq j - 1.
\]

(3.13)
Now, using the formulas (3.2), (3.4), (3.7), (3.8), and (3.13), we obtain the difference schemes of a \((2l + 2j)\)th order of accuracy

\[
\frac{u_{k+1} - 2u_k + u_{k-1}}{\tau^2} - \sum_{s=1}^{l} \alpha_s (-A)^s \tau^{2s-2} u_k - \sum_{s=1}^{j} \eta_s (-A)^s \tau^{2s-2} (u_{k-1} + u_{k+1}) = f_{k}^{j,l},
\]

\[
f_{k}^{j,l} = \sum_{s=1}^{j} \eta_s \sum_{\lambda=1}^{s} \frac{(-A)^{s-\lambda}}{\lambda} \left( f(2\lambda-2)(t_{k+1}) + f(2\lambda-2)(t_{k-1}) \right) \tau^{2s-2}
\]

\[
+ \sum_{s=1}^{l} \alpha_s \sum_{\lambda=1}^{s} \frac{(-A)^{s-\lambda}}{\lambda} f(2\lambda-2)(t_k) \tau^{2s-2}, \quad 1 \leq k \leq N - 1, \quad u_0 = v_0,
\]

\[
\frac{u_1 - u_0}{\tau} = \sum_{n=1}^{l} \rho_{2n} (-A)^n \tau^{2n-1} v(0) - \sum_{n=1}^{l} \rho_{2n-1} (-A)^{n-1} \tau^{2n-2} v'(0)
\]

\[
+ \sum_{n=1}^{j} \delta_{2n} (-A)^n \tau^{2n-1} u_1 + \sum_{n=1}^{j} \delta_{2n-1} (-A)^{n-1} \tau^{2n-2} \times \left( I + \sum_{n=1}^{l-[m/2]} a_{2n} (-A)^n \tau^{2n} \right)
\]

\[
\times \left\{ \left( I + \sum_{n=1}^{l-[m/2]} b_{2n} (-A)^n \tau^{2n} \right) v'(0) - \sum_{n=1}^{l-[m/2]} a_{2n-1} (-A)^n \tau^{2n-1} u_1
\]

\[
+ \sum_{n=1}^{j} b_{2n-1} (-A)^n \tau^{2n-1} v(0) \right\}
\]

\[
= \sum_{n=1}^{l} \rho_{2n} (-A)^n \tau^{2n-1} \sum_{\lambda=1}^{n} \frac{(-A)^n-\lambda f(2\lambda-2)(0)}{\lambda}
\]

\[
+ \sum_{n=1}^{l} \rho_{2n-1} (-A)^{n-1} \tau^{2n-2} \sum_{\lambda=1}^{n} \frac{(-A)^n-\lambda f(2\lambda-1)(0)}{\lambda}
\]

\[
- \sum_{n=1}^{j} \delta_{2n} (-A)^n \tau^{2n-1} \sum_{\lambda=1}^{n} \frac{(-A)^n-\lambda f(2\lambda-2)(\tau)}{\lambda}
\]

\[
- \sum_{n=1}^{j} \delta_{2n-1} (-A)^{n-1} \tau^{2n-2} \sum_{\lambda=1}^{n-1} \frac{(-A)^n-\lambda f(2\lambda-1)(\tau)}{\lambda}
\]

\[
- \sum_{m=1}^{j} \delta_{2m-1} (-A)^m \tau^{2m-2} \left( I + \sum_{n=1}^{l-[m/2]} a_{2n} (-A)^n \tau^{2n} \right)
\]

\[
\times \left\{ \left( I + \sum_{n=1}^{l-[m/2]} b_{2n} (-A)^n \tau^{2n} \right) v(0) - \sum_{n=1}^{l-[m/2]} a_{2n-1} (-A)^n \tau^{2n-1} u_1
\]

\[
+ \sum_{n=1}^{j} b_{2n-1} (-A)^n \tau^{2n-1} v(0) \right\}
\]

for the approximate solution of the initial value problem (1.1).
Suppose that the operator

$$
\left( I + \sum_{n=1}^{j} \delta_{2n}(-A)^{n} \tau^{2n} - \sum_{m=1}^{j} \delta_{2m-1}(-A)^{m} \tau^{2m-1} \right) \left( I + \sum_{n=1}^{l-[m/2]} a_{2n}(-A)^{n} \tau^{2n} \right)^{-1} \times \sum_{n=1}^{l-[m/2]} a_{2n-1}(-A)^{n} \tau^{2n-1}
$$

has a bounded inverse. Suppose further that the operator \((I - \sum_{s=1}^{j} \eta_{s}(-A)^{s} \tau^{2s})\) has a bounded inverse and

$$
I - \frac{1}{4} \left( 2I + \sum_{s=1}^{l} \alpha_{s}(-A)^{s} \tau^{2s} \right)^{2} \left( I - \sum_{s=1}^{j} \eta_{s}(-A)^{s} \tau^{2s} \right)^{-2} \geq 0.
$$

This problem is uniquely solvable, and the following formula holds:

$$
u_{k} = \left( \tilde{R}_{j,l}(-\imath \tau A) - \tilde{R}_{j,l}(\imath \tau A) \right)^{-1} \tilde{R}_{j,l}(\imath \tau A) \tilde{R}_{j,l}(-\imath \tau A) \left( \tilde{R}_{j,l}^{k-1}(-\imath \tau A) - \tilde{R}_{j,l}^{k-1}(\imath \tau A) \right) u_{0}
$$

$$+ \left( \tilde{R}_{j,l}(-\imath \tau A) - \tilde{R}_{j,l}(\imath \tau A) \right)^{-1} \left( \tilde{R}_{j,l}^{k}(-\imath \tau A) - \tilde{R}_{j,l}^{k}(\imath \tau A) \right) u_{1}
$$

$$+ \sum_{j=1}^{k} \left( \tilde{R}_{j,l}(-\imath \tau A) - \tilde{R}_{j,l}(\imath \tau A) \right)^{-1} \tilde{R}_{j,l}(\imath \tau A) \tilde{R}_{j,l}(-\imath \tau A)
$$

$$\times \left( \tilde{R}_{j,l}^{k-m}(-\imath \tau A) - \tilde{R}_{j,l}^{k-m}(\imath \tau A) \right) \left( I - \sum_{s=1}^{j} \eta_{s}(-A)^{s} \tau^{2s} \right)^{-1} f_{m}^{j,l}, \quad 2 \leq k \leq N,
$$

$$u_{1} = \tilde{c}_{r} \nu(0) + \tilde{s}_{r} \nu'(0) + \tau f_{0}^{j,l}.
$$

Here

$$
\tilde{R}_{j,l}(\pm \imath \tau A) = \frac{1}{2} \left( 2I + \sum_{s=1}^{l} \alpha_{s}(-A)^{s} \tau^{2s} \right) \left( I - \sum_{s=1}^{j} \eta_{s}(-A)^{s} \tau^{2s} \right)^{-1}
$$

$$\pm \imath \sqrt{I - \frac{1}{4} \left( 2I + \sum_{s=1}^{l} \alpha_{s}(-A)^{s} \tau^{2s} \right)^{2} \left( I - \sum_{s=1}^{j} \eta_{s}(-A)^{s} \tau^{2s} \right)^{-2}},
$$

$$\tilde{R}_{j,l}^{k-m}(\pm \imath \tau A) = \frac{1}{2} \left( 2I + \sum_{s=1}^{l} \alpha_{s}(-A)^{s} \tau^{2s} \right) \left( I - \sum_{s=1}^{j} \eta_{s}(-A)^{s} \tau^{2s} \right)^{-1}
$$

$$\pm \imath \sqrt{I - \frac{1}{4} \left( 2I + \sum_{s=1}^{l} \alpha_{s}(-A)^{s} \tau^{2s} \right)^{2} \left( I - \sum_{s=1}^{j} \eta_{s}(-A)^{s} \tau^{2s} \right)^{-2}},
$$

$$f_{m}^{j,l} = \tilde{c}_{r} \nu(0) + \tilde{s}_{r} \nu'(0) + \tau f_{0}^{j,l}.$$

(3.15)
\[ \tilde{c}_r = \left( I + \sum_{n=1}^{j} \delta_{2n}(-A)^n \tau^{2n} - \sum_{m=1}^{l-[m/2]} \delta_{2m-1}(-A)^m \tau^{2m-1} \right) \times \left( I + \sum_{n=1}^{j} a_{2n}(-A)^n \tau^{2n} \right) \times \left( \sum_{n=1}^{j-m+[m/2]+1} a_{2n-1}(-A)^n \tau^{2n-1} \right)^{-1} \times \left\{ \sum_{n=1}^{l} \rho_{2n}(-A)^n \tau^{2n-1} + \sum_{m=1}^{l-[m/2]} \delta_{2m-1}(-A)^m \tau^{2m-2} \times \left( I + \sum_{n=1}^{j} a_{2n}(-A)^n \tau^{2n} \right) \times \sum_{n=1}^{j-m+[m/2]+1} b_{2n-1}(-A)^n \tau^{2n-1} \right\}, \]

\[ \tilde{s}_r = \left( I + \sum_{n=1}^{j} \delta_{2n}(-A)^n \tau^{2n} - \sum_{m=1}^{l-[m/2]} \delta_{2m-1}(-A)^m \tau^{2m-1} \right) \times \left( I + \sum_{n=1}^{j} a_{2n}(-A)^n \tau^{2n} \right) \times \left( \sum_{n=1}^{j-m+[m/2]+1} a_{2n-1}(-A)^n \tau^{2n-1} \right)^{-1} \times \left\{ \sum_{n=1}^{l} \rho_{2n}(-A)^n \tau^{2n-1} + \sum_{m=1}^{l-[m/2]} \delta_{2m-1}(-A)^m \tau^{2m-2} \times \left( I + \sum_{n=1}^{j} a_{2n}(-A)^n \tau^{2n} \right) \times \sum_{n=1}^{j-m+[m/2]+1} b_{2n}(-A)^n \tau^{2n} \right\}, \]

\[ f_{0}^{j,l} = \left\{ \sum_{n=1}^{l} \rho_{2n}(-A)^n \tau^{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-2)}(0) \right. \]

\[ + \sum_{n=1}^{l} \rho_{2n-1}(-A)^{n-1} \tau^{2n-2} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-1)}(0) \]

\[ - \sum_{n=1}^{j} \delta_{2n}(-A)^n \tau^{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-2)}(\tau) \]

\[ - \sum_{n=1}^{j} \delta_{2n-1}(-A)^n \tau^{2n-2} \sum_{\lambda=1}^{n-1} (-A)^{n-\lambda} f^{(2\lambda-1)}(\tau) \]

\[ - \sum_{m=1}^{l-[m/2]} \left( I + \sum_{n=1}^{l-[m/2]} \delta_{2m-1}(-A)^m \tau^{2m-2} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-1)}(\tau) \right)^{-1} \times \left\{ \sum_{n=1}^{l-[m/2]} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-1)}(\tau) \tau^{2n} \right. \]

\[ - \sum_{n=1}^{j-m+[m/2]} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-2)}(\tau) \tau^{2n-1} \]

\[ + \sum_{n=1}^{l-[m/2]+1} b_{2n} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-1)}(0) \tau^{2n} \]

\[ + \sum_{n=1}^{j-m+[m/2]+1} b_{2n-1} \sum_{\lambda=1}^{n} (-A)^{n-\lambda} f^{(2\lambda-2)}(0) \tau^{2n-1} \right\}. \]
From the formula (3.17) it follows that the investigation of the stability of difference schemes (3.14) relies in an essential manner on a number of properties of the powers of the operator \( \tilde{R}_{j,l}(\pm i\tau A) \). We were not able to obtain the estimates for powers of the operator \( \tilde{R}_{j,l}(\pm i\tau A) \) in the general cases of numbers \( j \) and \( l \).

**Theorem 3.1.** Suppose that \( u_0 \in D(A) \), \( u_1 - u_0 \in D(A^{1/2}) \). Then for the solution of the two-step difference schemes (3.14) for \( l = 0 \) the following stability inequalities hold:

\[
\begin{align*}
\max_{0 \leq k \leq N} ||u_k||_H & \leq M \left[ \max_{1 \leq k \leq N-1} ||A^{-1} f_k^{j,l}||_H + ||A^{1/2} \tau^{-1} (u_1 - u_0)||_H + ||u_0||_H \right], \\
\max_{1 \leq k \leq N} ||\tau^{-1} (u_k - u_{k-1})||_H & \leq M \left[ \max_{1 \leq k \leq N-1} ||f_k^{j,l}||_H + ||\tau^{-1} (u_1 - u_0)||_H + ||A^{1/2} u_0||_H \right], \\
\max_{1 \leq k \leq N-1} ||\tau^{-2} (u_{k+1} - 2u_k + u_{k-1})||_H & \leq M \left[ \max_{2 \leq k \leq N-1} ||\tau^{-1} (f_k^{j,l} - f_{k-1}^{j,l})||_H + ||f_{k-1}^{j,l}||_H + ||A^{1/2} \tau^{-1} (u_1 - u_0)||_H + ||Au_0||_H \right], \\
\end{align*}
\]

where \( M \) does not depend on \( \tau, f_k^{j,l}, 1 \leq k \leq N-1 \), and \( u_0, u_1 \).

The proof of Theorem 3.1 follows the scheme of the proof of Theorem 2.1, and relies on the formula (3.17) and on the estimates

\[
\begin{align*}
||\tilde{R}_{j,l}(\pm i\tau A)||_{H \to H} & \leq 1, \\
||\tau A^{1/2} (I - \tilde{R}_{j,l}^2 (i\tau A))^{-1} \tilde{R}_{j,l}(i\tau A)||_{H \to H} & \leq M, \\
\left| \left| \left( I - \sum_{s=1}^{j} \eta_s (-A)^s \tau^{2s} \right)^{-1} \right| \right|_{H \to H} & \leq M.
\end{align*}
\]

**Remark 3.2.** Theorem 3.1 actually holds in the general cases of numbers \( j \) and \( l \) under the following assumption:

\[
\tau ||A||_{H \to H} \to 0 \quad \text{when} \quad \tau \to 0.
\]
Remark 3.3. Applying the formulas (2.37), (2.41), (2.44), (3.2), (3.7), and (3.13), we can construct the difference schemes of a $(2l+2j)$th order of accuracy

$$
\frac{u_{k+1} - 2u_k + u_{k-1}}{\tau^2} - \sum_{s=1}^{l} \alpha_s (-A)^s \tau^{2s-2} u_k - \sum_{s=1}^{j} \eta_s (-A)^s \tau^{2s-2} (u_{k-1} + u_{k+1}) = f_k^{i,j},
$$

$$
f_k^{i,j} = \sum_{s=1}^{j} \sum_{\lambda=1}^{s} (-A)^{s-\lambda} \left( f^{(2\lambda-2)}(t_{k+1}) + f^{(2\lambda-2)}(t_{k-1}) \right) \tau^{2s-2}
$$

$$
+ \sum_{s=1}^{l} \alpha_s \sum_{\lambda=1}^{s} (-A)^{s-\lambda} f^{(2\lambda-2)}(t_k) \tau^{2s-2}, \quad 1 \leq k \leq N - 1, \quad u_0 = \psi_0,
$$

(3.22)

for the approximate solution of the initial value problem (1.1). In a similar manner one can obtain the stability inequalities for the solution of the two-step difference schemes (3.22).

Now, the abstract Theorem 3.1 is applied in the investigation of difference schemes of higher order of accuracy with respect to one variable for approximate solutions of the mixed boundary value problem (1.19). The first step of discretization of problem (1.19) is given above. Suppose that the operator

$$
\left(I + \sum_{n=1}^{j} \delta_{2n} (-A)^n \tau^{2n} - \sum_{m=1}^{l} \delta_{2m-1} (-A)^m \tau^{2m-1} \left( I + \sum_{n=1}^{l-\lfloor m/2 \rfloor} a_{2n} (-A)^n \tau^{2n} \right)^{-1} \times \sum_{n=1}^{l-\lfloor m/2 \rfloor} a_{2n-1} (-A)^n \tau^{2n-1} \right)
$$

has a bounded inverse. Suppose further that the operator \((I - \sum_{s=1}^{j} \eta_s (-A_h^x)^s \tau^{2s})\) has a bounded inverse and

$$
I - \frac{1}{4} \left( 2I + \sum_{s=1}^{l} \alpha_s (-A_h^x)^s \tau^{2s} \right) \left( I - \sum_{s=1}^{j} \eta_s (-A_h^x)^s \tau^{2s} \right)^{-1} \geq 0.
$$

(3.24)

Then in the second step we replace problem (2.56) by the difference schemes (3.14):

$$
\tau^{-2} \left( u_{k+1}^h(x) - 2u_k^h(x) + u_{k-1}^h(x) \right) + \widetilde{A}_hx_k^h(x) + A\widetilde{A}_h(x) (u_{k+1}^h(x) + u_{k-1}^h(x)) = f_k^h(x),
$$

$$
t_k = k\tau, \quad 1 \leq k \leq N - 1, \quad x \in \Omega_h,
$$

with

$$
\widetilde{A}_h^x = -\sum_{s=1}^{l} \alpha_s (-A_h^x)^s \tau^{2s-2}, \quad A\widetilde{A}_h^x = -\sum_{s=1}^{j} \eta_s (-A_h^x)^s \tau^{2s-2},
$$
\[ f_k^h(x) = \sum_{s=1}^{j} \eta_s \sum_{\lambda=1}^{s} \left( -A_h^x \right)^{s-\lambda} \left( f^{(2\lambda-2)}(t_{k+1}, x) + f^{(2\lambda-2)}(t_{k-1}, x) \right) \tau^{2s-2} + \sum_{s=1}^{j} \alpha_i \sum_{\lambda=1}^{s} \left( -A_h^x \right)^{s-\lambda} \left( f^{(2\lambda-2)}(t_k, x) \right) \tau^{2s-2}, \quad 1 \leq k \leq N - 1, \]
\[ u_1^h(x) = \tilde{c}_r \varphi^h(x) + \tilde{s}_r \psi^h(x) + \tau f_0^h(x), \quad x \in \Omega_h, \]
\[ \tilde{c}_r = \left( I + \sum_{n=1}^{l-\left[m/2\right]} \delta_{2n} \left( -A_h^x \right)^n \tau^{2n} - \sum_{m=1}^{j} \delta_{2m-1} \left( -A_h^x \right)^m \tau^{2m-1} \right)^{-1} \left( I + \sum_{n=1}^{l-\left[m/2\right]} a_{2n} \left( -A_h^x \right)^n \tau^{2n} \right)^{-1} \sum_{n=1}^{l-\left[m/2\right]} a_{2n-1} \left( -A_h^x \right)^n \tau^{2n-1} \right), \]
\[ \tilde{s}_r = \left( I + \sum_{n=1}^{l-\left[m/2\right]} \delta_{2n} \left( -A_h^x \right)^n \tau^{2n} - \sum_{m=1}^{j} \delta_{2m-1} \left( -A_h^x \right)^m \tau^{2m-1} \right)^{-1} \left( I + \sum_{n=1}^{l-\left[m/2\right]} a_{2n} \left( -A_h^x \right)^n \tau^{2n} \right)^{-1} \sum_{n=1}^{l-\left[m/2\right]} a_{2n-1} \left( -A_h^x \right)^n \tau^{2n-1} \right), \]
\[ f_0^h(x) = \sum_{n=1}^{l} \rho_{2n} \left( -A_h^x \right)^n \tau^{2n-1} \sum_{\lambda=1}^{n} \left( -A_h^x \right)^{n-\lambda} f^{(2\lambda-2)}(0, x) + \sum_{n=1}^{l} \rho_{2n-1} \left( -A_h^x \right)^n \tau^{2n-2} \sum_{\lambda=1}^{n} \left( -A_h^x \right)^{n-\lambda} f^{(2\lambda-1)}(0, x) \]
\[ - \sum_{n=1}^{l} \delta_{2n} \left( -A_h^x \right)^n \tau^{2n-1} \sum_{\lambda=1}^{n} \left( -A_h^x \right)^{n-\lambda} f^{(2\lambda-2)}(\tau, x) \]
\[ - \sum_{n=1}^{l} \delta_{2n-1} \left( -A_h^x \right)^n \tau^{2n-2} \sum_{\lambda=1}^{n-1} \left( -A_h^x \right)^{n-\lambda} f^{(2\lambda-1)}(\tau, x) \]
\[ - \sum_{m=1}^{j} \delta_{2m-1} \left( -A_h^x \right)^m \tau^{2m-2} \left( I + \sum_{n=1}^{l-\left[m/2\right]} a_{2n} \left( -A_h^x \right)^n \tau^{2n} \right)^{-1} \]
Theorem 3.4. Let $\tau$ and $|h|$ be sufficiently small numbers. Then the solutions of the difference schemes (3.25) for $l = 0$ satisfy the following stability estimates:

$$\max_{0 \leq k \leq N} \| u^h_k \|_{L^2(\Omega_h)} \leq M_1 \left[ \max_{0 \leq k \leq N-1} \| (B^x_h)^{-1} f^h_k \|_{L^2(\Omega_h)} + \| (B^x_h)^{-1} \psi^h \|_{L^2(\Omega_h)} + \| \varphi^h \|_{L^2(\Omega_h)} \right],$$

$$\max_{1 \leq k \leq N} \| \tau^{-1}( u^h_k - u^h_{k-1} ) \|_{L^2(\Omega_h)} \leq M_1 \left[ \max_{0 \leq k \leq N-1} \| f^h_k \|_{L^2(\Omega_h)} + \| \psi^h \|_{L^2(\Omega_h)} + \sum_{l=1}^{n} \| \psi^h_{\lambda, m_l} \|_{L^2(\Omega_h)} \right],$$

$$\max_{1 \leq k \leq N-1} \| \tau^{-2}( u^h_{k+1} - 2u^h_k + u^h_{k-1} ) \|_{L^2(\text{bar}\Omega_h)} \leq M_1 \left[ \max_{1 \leq k \leq N-1} \| \tau^{-1}( f^h_k - f^h_{k-1} ) \|_{L^2(\Omega_h)} + \| f^h_0 \|_{L^2(\Omega_h)} \right. + \left. \sum_{r=1}^{n} \| \psi^h_{\lambda, m_r} \|_{L^2(\Omega_h)} + \sum_{r=1}^{n} \| (\varphi^h_{\lambda})_{\lambda, m_r} \|_{L^2(\Omega_h)} \right].$$

Here $M$ does not depend on $\tau$, $h$, $\varphi^h(x)$, $\psi^h(x)$, and $f^h_k(x)$, $0 \leq k \leq N - 1$.

The proof of Theorem 3.4 is based on the abstract Theorem 3.1, and the symmetry properties of the difference operator $A^x_h$ is defined by the formula (2.56).

Note that in a similar manner one can construct the difference schemes of a high order of accuracy with respect to one variable for approximate solutions of the boundary value problem (1.17). Abstract Theorem 3.1 permits us to obtain the stability estimates for the solutions of these difference schemes.

Special Issue on
Modeling Experimental Nonlinear Dynamics and Chaotic Scenarios

Call for Papers

Thinking about nonlinearity in engineering areas, up to the 70s, was focused on intentionally built nonlinear parts in order to improve the operational characteristics of a device or system. Keying, saturation, hysteretic phenomena, and dead zones were added to existing devices increasing their behavior diversity and precision. In this context, an intrinsic nonlinearity was treated just as a linear approximation, around equilibrium points.

Inspired on the rediscovering of the richness of nonlinear and chaotic phenomena, engineers started using analytical tools from “Qualitative Theory of Differential Equations,” allowing more precise analysis and synthesis, in order to produce new vital products and services. Bifurcation theory, dynamical systems and chaos started to be part of the mandatory set of tools for design engineers.

This proposed special edition of the Mathematical Problems in Engineering aims to provide a picture of the importance of the bifurcation theory, relating it with nonlinear and chaotic dynamics for natural and engineered systems. Ideas of how this dynamics can be captured through precisely tailored real and numerical experiments and understanding by the combination of specific tools that associate dynamical system theory and geometric tools in a very clever, sophisticated, and at the same time simple and unique analytical environment are the subject of this issue, allowing new methods to design high-precision devices and equipment.

Authors should follow the Mathematical Problems in Engineering manuscript format described at http://www.hindawi.com/journals/mpe/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
