STABILITY AND BIFURCATION IN A SIMPLIFIED FOUR-NEURON BAM NEURAL NETWORK WITH MULTIPLE DELAYS

XIANG-PING YAN AND WAN-TONG LI

Received 23 May 2005; Accepted 4 September 2005

We first study the distribution of the zeros of a fourth-degree exponential polynomial. Then we apply the obtained results to a simplified bidirectional associated memory (BAM) neural network with four neurons and multiple time delays. By taking the sum of the delays as the bifurcation parameter, it is shown that under certain assumptions the steady state is absolutely stable. Under another set of conditions, there are some critical values of the delay, when the delay crosses these critical values, the Hopf bifurcation occurs. Furthermore, some explicit formulae determining the stability and the direction of periodic solutions bifurcating from Hopf bifurcations are obtained by applying the normal form theory and center manifold reduction. Numerical simulations supporting the theoretical analysis are also included.

1. Introduction

In recent years, the interest in investigating the dynamics of neural networks has been steadily increasing since Hopfield [11] constructed a simplified neural network model. Based on the Hopfield neural network, Marcus and Westervelt [14] argued that time delays always appear in the signal transmission and therefore they proposed a neural network model with delays. Hereafter, various dynamical models modeling delayed neural networks have been proposed and investigated widely to understand the dynamics behavior of the like-neurons (see [1, 2, 6, 7]) and there has been an extensive literature on the local and global stability analysis of the delayed neural networks (see [6, 15, 19, 23] and the references cited therein). It is well known that the study on dynamical systems not only involve a discussion of stability, but also involve many dynamical behaviors such as periodic phenomenon, bifurcation and chaos. In particular, the properties of periodic solutions are of great interest, which can arise through the Hopf bifurcation in delayed systems, see Hale [8], Liu and Yuan [13], Wei and Ruan [20] and Wei and Velarde [21].

DOI 10.1155/DDNS/2006/32529
As large-scale nonlinear dynamical systems, neural networks are complex while the dynamics of the delayed neural networks are even richer and more complicated. Neural networks with delays can exhibit very rich dynamics [22]. Since an exhaustive analysis of the dynamics of large-scale dynamical systems is quite difficult, Babcock and Westervelt [1] suggested examining carefully the dynamical behaviors of the simple and lower-order networks. Consequently, in recent years, there has been an extensive literature about the studies of the dynamics of some special and simple lower-order neural networks (see [3–5, 7, 16, 17, 20, 22]). However, the studies of the dynamics regarding higher-order systems modelling the neural networks with more neurons and multiple delays are rare. To the best of our knowledge, there is a few literatures have investigated higher-order neural networks (see [18, 21] for the case of three neurons and multiple delays and [4, 12] for a ring of four neurons). In fact, in practical applications, the neural networks with more neurons and multiple delays are of great importance and frequency. Therefore, it is necessary to investigate the dynamical behaviors of this kind of networks.

In general, in the investigating on a delay model, linearization of the system at its steady state gives us a transcendental characteristic equation or called an exponential polynomial equation. It is well known that the steady state is stable if all eigenvalues of the corresponding transcendental characteristic equation have negative real parts, and unstable if at least one root has positive real part. Thus, a Hopf bifurcation occurs when the real part of a certain eigenvalue changes from negative to zero and to positive (i.e., the steady state changes from stability to instability). This is usually caused by the delays. However, there is a strong possibility that if the coefficients of the exponential polynomial satisfy certain assumptions, then the real parts of all eigenvalues remain negative for all values of the delay; that is, independent of the delay. The corresponding delay system is called absolutely stable (see, e.g., Hale et al. [9]). A general result in Hale et al. [9] says that a delay system is absolutely stable if and only if the corresponding ODE system is asymptotically stable and the characteristic equation has no purely imaginary roots. Therefore, a first important step in the study of the dynamics of a delayed model is to analyze in detail the distribution of zeros of the associated characteristic equation. However, most aforementioned works on the neural network focused mainly on the second-dimensional case and hence the associated characteristic equation is also second-degree exponential polynomial equation. Thus, the second-degree exponential polynomial equation has been investigated widely and exhaustively (see [20] and the cited reference therein). As far as the study of third and fourth-degree exponential polynomial equation, there are also a few literature (see, e.g., [17, 18] for the case of the third degree and [4, 12] for the case of the fourth degree).

Among a great deal of artificial neural networks, there exist a class of important two-layer heteroassociative networks, called bidirectional associative memory (BAM) neural networks with axonal signal transmission delays, has been proposed and applied in many fields such as pattern recognition and automatic control (see [6]). If there is only one neuron on the I-layer and three neurons on the J-layer, the time delay from the I-layer to another J-layer is $\tau_1$ while the delay from the J-layer back to the I-layer is $\tau_2$, and the activation functions are $f_j$ ($l = 2, 3, 4$) (see Figure 1.1). Then the network model can be described by the following delayed differential equations, namely, functional differential
where $x_k$ ($k = 1, 2, 3, 4$) denote the state of the $k$th neuron; $\mu_k > 0$ ($k = 1, 2, 3, 4$) describe respectively the stability of internal neuron processes on the $I$-layer and the $J$-layer; the real constants $c_{l1}$ ($l = 2, 3, 4$) and $c_{1k}$ ($k = 2, 3, 4$) denote the connected weights through the neurons in two layers: the $I$-layer and the $J$-layer.

The linearization of the system (1.1) at its steady state leads to a transcendental characteristic equation in the form of

$$\lambda^4 + a_3\lambda^3 + a_2\lambda^2 + a_1\lambda + a_0 + (b_2\lambda^2 + b_1\lambda + b_0)e^{-\lambda\tau} = 0,$$

which is a fourth-degree exponential polynomial equation.

If $b_1 = b_2 = 0$, then (1.1) reduces to

$$\lambda^4 + a_3\lambda^3 + a_2\lambda^2 + a_1\lambda + a_0 + b_0e^{-\lambda\tau} = 0,$$

which was investigated by Li and Wei [12], and applied the obtained results to a ring of neural network model consisting of four different neurons with instantaneous self-connection and multiple delays, see Figure 1.2.

Clearly, if $b_1^2 + b_2^2 \neq 0$, then the results obtained by Li and Wei [12] fail to (1.2). Therefore, in order to study the dynamics of the neural network (1.1), it is necessary to investigate further the fourth-degree exponential polynomial equation (1.2) with $b_1^2 + b_2^2 \neq 0$.

In this paper, we first study the distribution of the roots of (1.2) and find that there are the following two possibilities.

(a) Under certain assumptions on the coefficients, all roots of (1.2) have negative real parts for all delay value $\tau \geq 0$.

(b) If the assumptions in (a) are not satisfied, then there is a critical value $\tau_0$. When the delay $\tau < \tau_0$, the real parts of all roots of (1.2) are still negative; when $\tau = \tau_0$, there is
Figure 1.2. A four-neuron ring with delays and self-connection.

A BAM neural network with multiple delays

By regarding the sum $\tau$ of the two delays $\tau_1$ and $\tau_2$ as a bifurcation parameter, applying the obtained results to the BAM neural network (1.2), we show that under a set of assumptions on the coefficients, the steady state is absolutely stable (i.e., asymptotically stable independent of the delay $\tau$). Under another set of conditions, the steady state is conditionally stable; that is, there is a sequence of critical delay values $\tau_0 < \tau_1 < \ldots$, and the steady state is asymptotically stable when $\tau < \tau_0$, loses its stability when $\tau = \tau_0$, and becomes unstable when $\tau > \tau_0$. Thus, a Hopf bifurcation occurs at the steady state when $\tau$ passes through the critical values $\tau_j (j = 0, 1, \ldots)$.

This paper is organized as follows. In the next section, we will analyze in detail the distribution of roots of the fourth exponential polynomial equation (1.1). In Section 3, we apply the results obtained in Section 2 to (1.2), the absolute stability, conditional stability of zero equilibrium and the existence of Hopf bifurcation are studied. In Section 4, based on the normal form theory and the center manifold argument introduced by Hassard et al. [10], we derive the formulae determining the direction, stability and the period of the bifurcating periodic solution. In Section 5, by applying the results obtained in Section 4, we give a result for a special case of (1.1) determining the direction, stability and the period of the bifurcating periodic solution. Finally, to verify the theoretic analysis, a conclusion is also drawn in the end.

2. The fourth-degree transcendental polynomial equation

In this section, we will study in detail the distribution of zeros of the fourth-degree transcendental polynomial equation (1.2).

Consider the following fourth-degree transcendental polynomial equation

$$
\lambda^4 + a_3 \lambda^3 + a_2 \lambda^2 + a_1 \lambda + a_0 + (b_2 \lambda^2 + b_1 \lambda + b_0) e^{-\lambda \tau} = 0,
$$

(2.1)

where $a_k, b_l \in \mathbb{R}$ ($k = 0, 1, 2, 3; l = 0, 1, 2$) are all real constants and $\sum_{l=0}^{2} b_l^2 \neq 0$. Clearly, $i\omega$ ($\omega > 0$) is a root of (2.1) if and only if $\omega$ satisfies the following equation

$$
\omega^4 - i a_3 \omega^3 - a_2 \omega^2 + i a_1 \omega + a_0 + (- b_2 \omega^2 + i b_1 \omega + b_0) (\cos \omega \tau - i \sin \omega \tau) = 0.
$$

(2.2)
Separating the real and imaginary parts of the above equation yields the following equations

\[
\omega^4 - a_2 \omega^2 + a_0 = (b_2 \omega^2 - b_0) \cos \omega \tau - b_1 \omega \sin \omega \tau,
\]

\[
-a_3 \omega^3 + a_1 \omega = -(b_2 \omega^2 - b_0) \sin \omega \tau - b_1 \omega \cos \omega \tau.
\]

(2.3)

Adding up the squares of the corresponding sides of the above equations leads to

\[
\omega^8 + a_2^2 \omega^4 + (2a_0 + a_2^2 - 2a_1 a_3 - b_2^2) \omega^4
\]

\[
+ (a_1^2 - 2a_0 a_2 + 2b_0 b_2 - b_1^2) \omega^2 + a_0^2 - b_0^2 = 0.
\]

(2.4)

Let \( z = \omega^2 \) and denote

\[
a = a_3^2 - 2a_2, \quad b = 2a_0 + a_2^2 - 2a_1 a_3 - b_2^2,
\]

\[
c = a_1^2 - 2a_0 a_2 + 2b_0 b_2 - b_1^2, \quad d = a_0^2 - b_0^2.
\]

(2.5)

Then, (2.4) can be denoted simply as the following equation:

\[
z^4 + az^3 + bz^2 + cz + d = 0.
\]

(2.6)

Let

\[
h(z) = z^4 + az^3 + bz^2 + cz + d.
\]

(2.7)

Noting that \( \lim_{z \to \pm \infty} h(z) = +\infty \), we conclude that if \( d < 0 \), then (2.6) has at least one positive root.

From (2.7), we have

\[
\frac{dh(z)}{dz} = 4z^3 + 3az^2 + 2bz + c = 4f(z),
\]

where \( f(z) = z^3 + (3/4)az^2 + (1/2)bz + (1/4)c \). Let

\[
p = \frac{8b - 3a^2}{16}, \quad q = \frac{a^3 - 4ab + 8c}{32}, \quad D_0 = \frac{q^2}{4} + \frac{p^3}{27}.
\]

(2.9)

Suppose that \( D_0 > 0 \), then from the Cardano’s formulae for the third-degree algebra equation, we know that the equation \( f(z) = 0 \) has only one real root

\[
z^* = -\frac{a}{4} + \sqrt[3]{-\frac{q}{2}} + \sqrt{\frac{q^2}{4} + \frac{p^3}{27}}.
\]

(2.10)

Noticing that \( \lim_{z \to \pm \infty} h(z) = +\infty \), thus we know that \( z^* \) is a unique minimum value point of \( h(z) \) on \( \mathbb{R} \). Therefore, if \( d \geq 0 \) and \( z^* \leq 0 \), then (2.6) has no positive roots; if \( d \geq 0 \), \( z^* > 0 \) and \( h(z^*) < 0 \), then (2.6) has at least one positive roots.

Assume that \( D_0 = 0 \), then in this case the equation \( f(z) = 0 \) has three real roots

\[
z_1 = -\frac{a}{4} - 2\sqrt[3]{\frac{q}{2}}, \quad z_2 = z_3 = -\frac{a}{4} + \frac{\sqrt[3]{q}}{2},
\]

(2.11)
Let
\[ z^*_i = \max \left\{ -\frac{a}{4} - 2\sqrt{\frac{q}{2}}, -\frac{a}{4} + 2\sqrt{\frac{q}{2}} \right\}, \]
(2.12)
it is easy to know that \( h(z) \) is strictly monotonously increasing when \( z > z^*_i \). Therefore, if \( d \geq 0 \) and \( z^*_i \leq 0 \), then (2.6) has no positive roots; if \( d \geq 0 \), \( z^*_i > 0 \) and \( h(z^*_i) < 0 \), then (2.6) has at least one positive root.

If \( D_0 < 0 \), then we know that the equation \( f(z) = 0 \) has three real roots
\[ r^*_1 = -\frac{a}{4} + 2\text{Re}\{\alpha\}, \quad r^*_2 = -\frac{a}{4} + 2\text{Re}\{\alpha\}, \quad r^*_3 = -\frac{a}{4} + 2\text{Re}\{\alpha\}, \]
(2.13)
where \( \alpha \) is one of cubic roots of the complex number \(-q/2 + \sqrt{D_0} \) and \( \varepsilon = -1/2 + (\sqrt{3}/2)i \). Let \( z^*_i = \max\{r^*_1, r^*_2, r^*_3\} \), we can see that if \( d \geq 0 \) and \( z^*_i \leq 0 \), then (2.6) has no positive roots; if \( d \geq 0 \), \( z^*_i > 0 \) and \( h(z^*_i) < 0 \), then (2.6) has at least one positive root.

Summarizing these remarks, we have the following result.

**Lemma 2.1.** (i) If \( d < 0 \), then (2.6) has at least one positive root.

(ii) Suppose that \( d \geq 0 \), then (2.6) has no positive root if one of the following conditions holds:

1. \( D_0 > 0 \) and \( z^*_1 < 0 \);
2. \( D_0 = 0 \) and \( z^*_2 < 0 \);
3. \( D_0 < 0 \) and \( z^*_3 < 0 \).

(iii) Suppose that \( d \geq 0 \), then (2.6) has at least a positive root if one of the following conditions holds:

1. \( D_0 > 0 \), \( z^*_1 > 0 \) and \( h(z^*_1) < 0 \);
2. \( D_0 = 0 \), \( z^*_2 > 0 \) and \( h(z^*_2) < 0 \);
3. \( D_0 < 0 \), \( z^*_3 > 0 \) and \( h(z^*_3) < 0 \).

Suppose now that (2.6) has positive roots. Without loss of generality, we may assume that (2.6) has four positive roots denoted respectively as \( z_1, z_2, z_3 \) and \( z_4 \). Then (2.4) has four positive roots \( \omega_k = \sqrt{\Delta_k} \) (\( k = 1, 2, 3, 4 \)). In view of (2.3), we can get
\[ \cos \omega_k \tau = \frac{\Delta_1}{\Delta}, \]
(2.14)
where
\[ \Delta_1 = b_2 \omega_k^6 + (a_3 b_1 - a_2 b_2 - b_0) \omega_k^4 + (a_0 b_2 + a_2 b_0 - a_1 b_1) \omega_k^2 - a_0 b_0, \]
\[ \Delta = b_2^2 \omega_k^4 + (b_1^2 - 2b_0 b_2) \omega_k^2 + b_0^2. \]
(2.15)
Therefore, if we define
\[ \tau_j^{(k)} = \frac{1}{\omega_k} \left[ \arccos \left( \frac{\Delta_1}{\Delta} \right) + 2j\pi \right], \quad k = 1, 2, 3, 4, \quad j = 0, 1, 2, \ldots, \]
(2.16)
then (2.1) with \( \tau = \tau_j^{(k)} \) has a pair of purely imaginary roots \( \pm i\omega_k \). Let
\[ \tau_0 = \tau_0^{(k_0)} = \min_{k \in \{1, 2, 3, 4\}} \{ \tau_j^{(k)} \}, \quad \omega_0 = \omega_{k_0}. \]
(2.17)
In what follows, we use a result due to Ruan and Wei [17] to analyze (2.1), which is stated as follows.

**Lemma 2.2.** Consider the exponential polynomial

\[
P(\lambda, e^{-\lambda \tau_1}, e^{-\lambda \tau_2}, \ldots, e^{-\lambda \tau_m}) = \lambda^n + p_1^{(0)} \lambda^{n-1} + \cdots + p_{n-1}^{(0)} \lambda + p_n^{(0)}
\]

\[
+ \left[ p_1^{(1)} \lambda^{n-1} + \cdots + p_{n-1}^{(1)} \lambda + p_n^{(1)} \right] e^{-\lambda \tau_1}
\]

\[
+ \cdots + \left[ p_1^{(m)} \lambda^{n-1} + \cdots + p_{n-1}^{(m)} \lambda + p_n^{(m)} \right] e^{-\lambda \tau_m},
\]

(2.18)

where \( \tau_k \geq 0 \) \( (k = 1, 2, \ldots, m) \) and \( p_j^{(k)} \) \( (k = 0, 1, 2, \ldots, m, j = 1, 2, \ldots, n) \) are real constants. As \((\tau_1, \tau_2, \ldots, \tau_m)\) vary, the sum of the order of the zeros of \( P(\lambda, e^{-\lambda \tau_1}, e^{-\lambda \tau_2}, \ldots, e^{-\lambda \tau_m}) \) on the open right half-plane can change only if a zero appears on or crosses the imaginary axis.

Note that when \( \tau = 0 \), (2.1) becomes the following fourth-degree algebra equation

\[
\lambda^4 + a_3 \lambda^3 + (a_2 + b_2) \lambda^2 + (a_1 + b_1) \lambda + a_0 + b_0 = 0.
\]

(2.19)

It is easily to get the following result regarding the distribution of roots of the exponential polynomial equation (2.1) by using Lemmas 2.1 and 2.2.

**Lemma 2.3.** For the exponential polynomial equation (2.1), the following states are true.

(i) If \( d \geq 0 \) and one of the following conditions holds,

1. \( D_0 > 0 \) and \( z_1^* < 0 \);
2. \( D_0 = 0 \) and \( z_2^* < 0 \);
3. \( D_0 < 0 \) and \( z_3^* < 0 \),

then the order of all roots with positive real parts of (2.1) has the same sum as that of all roots with positive real parts of (2.19) for all \( \tau \geq 0 \).

(ii) If \( d < 0 \) or \( d \geq 0 \) and one of the following conditions holds,

1. \( D_0 > 0 \), \( z_1^* > 0 \) and \( h(z_1^*) > 0 \);
2. \( D_0 = 0 \), \( z_2^* > 0 \) and \( h(z_2^*) < 0 \);
3. \( D_0 < 0 \), \( z_3^* > 0 \) and \( h(z_3^*) < 0 \),

then the order of all roots with positive real parts of (2.19) has the same sum as that of all roots with positive real parts of (2.19) for all \( \tau \in [0, \tau_0) \).

Let

\[
\lambda_k(\tau) = \alpha_k(\tau) \pm i \omega_k(\tau), \quad k = 1, 2, 3, 4,
\]

(2.20)

be the root of (2.1) near \( \tau = \tau_j^{(k)} \) satisfying

\[
\alpha_k(\tau_j^{(k)}) = 0, \quad \omega_k(\tau_j^{(k)}) = \omega_k, \quad k = 1, 2, 3, 4, \quad j = 0, 1, 2, \ldots.
\]

(2.21)
LEMMA 2.4. Suppose that $z_k = \omega_k^2$ and $dh(z_k)/dz \neq 0$. Then the following transversality conditions hold:

$$\text{Re} \left[ \frac{d\lambda_k(\tau)}{d\tau} \right]_{\tau = \tau_j^{(k)}} \neq 0,$$

and the sign of $\text{Re} [d\lambda_k(\tau)/d\tau]_{\tau = \tau_j^{(k)}}$ is the same as that of $dh(z_k)/dz$.

Proof. Differentiating the two sides of (2.1) with respect to $\tau$ and noticing that $\lambda$ is the function of $\tau$, one can obtain

$$\left\{ 4\lambda^3 + 3a_3\lambda^2 + 2a_2\lambda + a_1 + \left[ (2b_2\lambda + b_1) - \tau(b_2\lambda^2 + b_1\lambda + b_0) \right] e^{-\lambda\tau} \right\} \frac{d\lambda}{d\tau} = (b_2\lambda^2 + b_1\lambda + b_0)\lambda e^{-\lambda\tau}.$$  

(2.23)

Thus, we have

$$\left( \frac{d\lambda}{d\tau} \right)^{-1} = \frac{(4\lambda^3 + 3a_3\lambda^2 + 2a_2\lambda + a_1) e^{\lambda\tau}}{(b_2\lambda^2 + b_1\lambda + b_0)\lambda} + \frac{2b_2\lambda + b_1}{(b_2\lambda^2 + b_1\lambda + b_0)\lambda} - \frac{\tau}{\lambda}.$$  

(2.24)

Notice that $\lambda = \pm i\omega_k$ when $\tau = \tau_j^{(k)}$ ($k = 1, 2, 3, 4, j = 0, 1, 2, \ldots$) and we only need to consider the case that $\lambda = i\omega_k$ because the case $\lambda = -i\omega_k$ can be obtained similarly. Accordingly, when $\tau = \tau_j^{(k)}$ ($k = 1, 2, 3, 4, j = 0, 1, 2, \ldots$), we have

$$\left[ (b_2\lambda^2 + b_1\lambda + b_0)\lambda \right]_{\tau = \tau_j^{(k)}} = (- b_2\omega_k^2 + ib_1\omega_k + b_0) i\omega_k = -b_1\omega_k^4 + i(b_0 - b_2\omega_k^2)\omega_k,$$

$$[2b_2\lambda + b_1]_{\tau = \tau_j^{(k)}} = b_1 + 2ib_2\omega_k,$$

$$\left[ (4\lambda^3 + 3a_3\lambda^2 + 2a_2\lambda + a_1) e^{\lambda\tau} \right]_{\tau = \tau_j^{(k)}} = (- 4i\omega_k^3 - 3a_3\omega_k^2 + 2ia_2\omega_k + a_1) \left( \cos \omega_k \tau_j^{(k)} + i\sin \omega_k \tau_j^{(k)} \right)$$

$$= \left[ (a_1 - 3a_3\omega_k^2) \cos \omega_k \tau_j^{(k)} - 2\omega_k (a_2 - 2a_3\omega_k^2) \sin \omega_k \tau_j^{(k)} \right] + i \left[ 2\omega_k (a_2 - 2a_3\omega_k^2) \cos \omega_k \tau_j^{(k)} + (a_1 - 3a_3\omega_k^2) \sin \omega_k \tau_j^{(k)} \right].$$  

(2.25)

Let

$$M = \left| - b_1\omega_k^2 + i(b_0 - b_2\omega_k^2)\omega_k \right|^2 = b_1^2\omega_k^4 + (b_0 - b_2\omega_k^2)^2\omega_k^2.$$  

(2.26)
Therefore, from (2.3) and (2.25) that

\[
\text{Re} \left[ \frac{(4\lambda^3 + 3a_3\lambda^2 + 2a_2\lambda + a_1) e^{\lambda r}}{(b_2\lambda^2 + b_1\lambda + b_0)\lambda} \right]_{\tau = r_j^{(k)}}
\]

\[
= \frac{1}{M} \left\{ -b_1\omega_k^2 \left[ (a_1 - 3a_3\omega_k^2) \cos \omega_k r_j^{(k)} - 2\omega_k (a_2 - 2\omega_k^2) \sin \omega_k r_j^{(k)} \right] 
+ (b_0 - b_2\omega_k^2) \omega_k \left[ 2\omega_k (a_2 - 2\omega_k^2) \cos \omega_k r_j^{(k)} + (a_1 - 3a_3\omega_k^2) \sin \omega_k r_j^{(k)} \right] \right\}
\]

\[
= \frac{1}{M} \left\{ (a_1 - 3a_3\omega_k^2) \omega_k \left[ - \left( b_2\omega_k^2 - b_0 \right) \sin \omega_k r_j^{(k)} - b_1\omega_k \cos \omega_k r_j^{(k)} \right] 
+ 2(a_2 - 2\omega_k^2) \omega_k^2 \left[ - \left( b_2\omega_k^2 - b_0 \right) \cos \omega_k r_j^{(k)} + b_1\omega_k \sin \omega_k r_j^{(k)} \right] \right\}
\]

\[
= \frac{1}{M} \left\{ (a_1 - 3a_3\omega_k^2) \omega_k \left[ - a_3 \omega_k^3 + a_1 \omega_k - 2(a_2 - 2\omega_k^2) \omega_k^2 (\omega_k^4 - 2\omega_k^2 + a_0) \right] 
= \frac{\omega_k^2}{M} \left\{ 4a_k^6 + 3(a_3 - 2a_2) \omega_k^4 + 2(2a_0 + a_2^2 - 2a_1 a_3) \omega_k^2 + a_1^2 - 2a_0 a_2 \right\},
\]

\[
\text{Re} \left[ \frac{2b_2\lambda + b_1}{(b_2\lambda^2 + b_1\lambda + b_0)\lambda} \right]_{\tau = r_j^{(k)}}
\]

\[
= \frac{1}{M} \left[ -b_1^2 \omega_k^2 + 2b_2\omega_k (b_0 - b_2\omega_k^2) \omega_k \right] = \frac{\omega_k^2}{M} \left( -2b_2^2 \omega_k^2 + 2b_0 b_2 - b_1^2 \right).
\]

(2.27)

Therefore, from (2.5) and (2.27), we can get

\[
\text{Re} \left[ \left( \frac{d\lambda_k(\tau)}{d\tau} \right)_{|\tau = r_j^{(k)}}^{-1} \right]
\]

\[
= \text{Re} \left\{ \left[ \frac{(4\lambda^3 + 3a_3\lambda^2 + 2a_2\lambda + a_1) e^{\lambda r}}{(b_2\lambda^2 + b_1\lambda + b_0)\lambda} \right]_{\tau = r_j^{(k)}} \right\} + \text{Re} \left\{ \left[ \frac{(b_2\lambda + b_1)}{(b_2\lambda^2 + b_1\lambda + b_0)\lambda} \right]_{\tau = r_j^{(k)}} \right\}
\]

\[
= \frac{\omega_k^2}{M} \left\{ 4a_k^6 + 3(a_3 - 2a_2) a_k^4 + 2(2a_0 + a_2^2 - 2a_1 a_3 - b_2^2) \omega_k^2 + a_1^2 - 2a_0 a_2 + 2b_0 b_2 - b_1^2 \right\}
\]

\[
= \frac{z_k}{M} (4a_k^3 + 3a_2 z + 2b z_k + c) = \frac{z_k}{M} \frac{dh(z_k)}{dz} \neq 0.
\]

(2.28)

Thus, \( \text{Re}[d\lambda_k(\tau)/d\tau]_{|\tau = r_j^{(k)}} \neq 0 \). In addition, since \( z_k > 0 \), we conclude that \( \text{Re}[d\lambda_k(\tau)/d\tau]_{|\tau = r_j^{(k)}} \) and \( dh(z_k)/dz \) have the same sign. This completes the proof. \( \Box \)
3. The simplified delayed four-neuron BAM neural network

In this section, we will apply the results obtained in Section 2 to study the stability and bifurcation of the simplified BAM neural network (1.1).

Throughout this section, we will assume that the activation functions \( f_k \) ( \( k = 1, 2, 3, 4 \)) of BAM network model (1.1) satisfy the following conditions:

\[(H_1) \ f_k \in C^1(\mathbb{R}, \mathbb{R}), \ f_k(0) = 0.\]

Under the assumption \((H_1)\), we know easily that \((0, 0, 0, 0)\) is an equilibrium of system (1.1) and let \( u_k(t) \) ( \( k = 1, 2, 3, 4 \)) be defined respectively by \( u_1(t) = x_1(t - \tau_1), \ u_k(t) = x_k(t) \) ( \( k = 2, 3, 4 \)) and \( \tau = \tau_1 + \tau_2 \), then system (1.1) is equivalent to the following system

\[
\begin{align*}
\dot{u}_1(t) &= -\mu_1 u_1(t) + c_{21} f_1(u_2(t - \tau)) + c_{31} f_1(u_3(t - \tau)) + c_{41} f_1(u_4(t - \tau)), \\
\dot{u}_2(t) &= -\mu_2 u_2(t) + c_{12} f_2(u_1(t)), \\
\dot{u}_3(t) &= -\mu_3 u_3(t) + c_{13} f_3(u_1(t)), \\
\dot{u}_4(t) &= -\mu_4 u_4(t) + c_{14} f_4(u_1(t)).
\end{align*}
\]

Linearized system of (3.1) near the equilibrium \((0,0,0,0)\) gives the following linear system

\[
\begin{align*}
\dot{u}_1(t) &= -\mu_1 u_1(t) + \alpha_{21} u_2(t - \tau) + \alpha_{31} u_3(t - \tau) + \alpha_{41} u_4(t - \tau), \\
\dot{u}_2(t) &= -\mu_2 u_2(t) + \alpha_{12} u_1(t), \\
\dot{u}_3(t) &= -\mu_3 u_3(t) + \alpha_{13} u_1(t), \\
\dot{u}_4(t) &= -\mu_4 u_4(t) + \alpha_{14} u_1(t),
\end{align*}
\]

where \( \alpha_{kl} = c_{kl} f'_k(0) \) ( \( k = 2, 3, 4 \)) and \( \alpha_{li} = c_{li} f'_l(0) \) ( \( l = 2, 3, 4 \)). The corresponding characteristic equation of system (3.2) is given by

\[
\det \begin{bmatrix}
\lambda + \mu_1 & -\alpha_{21} e^{-\lambda \tau} & -\alpha_{31} e^{-\lambda \tau} & -\alpha_{41} e^{-\lambda \tau} \\
-\alpha_{12} & \lambda + \mu_2 & 0 & 0 \\
-\alpha_{13} & 0 & \lambda + \mu_3 & 0 \\
-\alpha_{14} & 0 & 0 & \lambda + \mu_4
\end{bmatrix} = 0,
\]

that is

\[
\lambda^4 + (\mu_1 + \mu_2 + \mu_3 + \mu_4) \lambda^3 + (\mu_1 \mu_2 + \mu_1 \mu_3 + \mu_1 \mu_4 + \mu_2 \mu_3 + \mu_2 \mu_4 + \mu_3 \mu_4) \lambda^2 \\
+ (\mu_1 \mu_2 \mu_3 + \mu_1 \mu_2 \mu_4 + \mu_1 \mu_3 \mu_4 + \mu_2 \mu_3 \mu_4) \lambda + \mu_1 \mu_2 \mu_3 \mu_4 \\
- \{(\alpha_{12} \alpha_{21} + \alpha_{13} \alpha_{31} + \alpha_{14} \alpha_{41}) \lambda^2 \\
+ [\alpha_{12} \alpha_{21} (\mu_3 + \mu_4) + \alpha_{13} \alpha_{31} (\mu_2 + \mu_4) + \alpha_{14} \alpha_{41} (\mu_2 + \mu_3)] \lambda \\
+ \alpha_{12} \alpha_{21} \mu_3 \mu_4 + \alpha_{13} \alpha_{31} \mu_2 \mu_4 + \alpha_{14} \alpha_{41} \mu_2 \mu_3 \} e^{-\lambda \tau} = 0.
\]
In the sequel, we apply the results obtained in Section 2 to investigate (3.4), and obtain the sufficient conditions ensuring the stability of the equilibrium \((0,0,0,0)\) and Hopf bifurcation of system (1.1). From (2.1) and (3.4), one can see easily that

\[
a_3 = \mu_1 + \mu_2 + \mu_3 + \mu_4 > 0,
\]

\[
a_2 = \mu_1 \mu_2 + \mu_1 \mu_3 + \mu_1 \mu_4 + \mu_2 \mu_3 + \mu_2 \mu_4 + \mu_3 \mu_4 > 0,
\]

\[
a_1 = \mu_1 \mu_2 \mu_3 + \mu_1 \mu_2 \mu_4 + \mu_1 \mu_3 \mu_4 + \mu_2 \mu_3 \mu_4 > 0,
\]

\[
a_0 = \mu_1 \mu_2 \mu_3 \mu_4 > 0,
\]

\[
b_2 = - (\alpha_1 \alpha_2 \alpha_1 + \alpha_3 \alpha_3 + \alpha_4 \alpha_4),
\]

\[
b_1 = - [\alpha_1 \alpha_2 (\mu_3 + \mu_4) + \alpha_1 \alpha_3 \alpha_1 (\mu_2 + \mu_3) + \alpha_4 \alpha_4 (\mu_2 + \mu_3)],
\]

\[
b_0 = - (\alpha_1 \alpha_2 \alpha_1 \mu_4 + \alpha_1 \alpha_3 \alpha_1 \mu_4 + \alpha_4 \alpha_4 \alpha_1 \mu_2 \mu_3),
\]

which, together with (2.5), means that

\[
a = a_3^2 - 2a_2 = \mu_1^2 + \mu_2^2 + \mu_3^2 + \mu_4^2 > 0,
\]

\[
b = 2a_0 + a_2^2 - 2a_1 a_3 - b_2^2 = \mu_1^2 \mu_2^2 + \mu_1^2 \mu_3^2 + \mu_1^2 \mu_4^2 + \mu_2^2 \mu_3^2 + \mu_2^2 \mu_4^2 + \mu_3^2 \mu_4^2
\]

\[- (\alpha_1 \alpha_2 \alpha_1 + \alpha_3 \alpha_3 + \alpha_4 \alpha_4)^2,
\]

\[
c = a_1^2 - 2a_0 a_2 + 2b_0 b_2 - b_2^2 = \mu_1^2 \mu_2^2 \mu_3 + \mu_1^2 \mu_2^2 \mu_4 + \mu_1^2 \mu_3^2 \mu_4 + \mu_2^2 \mu_3^2 \mu_4
\]

\[+ 2(\alpha_1 \alpha_2 \alpha_1 + \alpha_3 \alpha_3 + \alpha_4 \alpha_4)(\alpha_1 \alpha_2 \alpha_1 \mu_4 + \alpha_3 \alpha_3 \mu_4 + \alpha_4 \alpha_4 \mu_2 \mu_3)
\]

\[- [\alpha_1 \alpha_2 (\mu_3 + \mu_4) + \alpha_1 \alpha_3 \alpha_1 (\mu_2 + \mu_3) + \alpha_4 \alpha_4 (\mu_2 + \mu_3)]^2,
\]

\[
d = a_0^2 - b_0^2 = \mu_1^2 \mu_2^2 \mu_3 \mu_4 - (\alpha_1 \alpha_2 \alpha_1 \mu_3 \mu_4 + \alpha_3 \alpha_3 \mu_2 \mu_4 + \alpha_4 \alpha_4 \mu_2 \mu_3)^2.
\]

Thus, we can calculate (2.7) and (2.9). Furthermore, from the sign of \(D_0\), we can also know \(z_1^+ (D_0 > 0)\), \(z_2^+ (D_0 = 0)\) or \(z_2^+ (D_0 < 0)\). In addition, in view of Routh-Hurwitz criteria, we can easily know that all roots of (3.4) with \(\tau = 0\) have negative real parts if the following condition holds:

\[(H_2) \ a_0 + b_0 > 0, \ a_1 + b_1 > 0, \ a_3 > 0 \text{ and } a_3 [(a_1 + b_1)(a_2 + b_2) - a_3 (a_0 + b_0)] > (a_1 + b_1)^2.
\]

By Lemmas 2.3 and 2.4, we have the following result regarding on stability and bifurcation of system (1.1).

**Theorem 3.1.** Let \(a_k, b_l \ (k = 0, 1, 2, 3; l = 0, 1, 2, 3)\), \(a, b, c, d, \) and \(e_j^{(k)}\) be defined, respectively, by (3.5), (3.6), and (2.16). Suppose that \((H_1)\) and \((H_2)\) hold. Then, for system (3.1), the following statements are true.

(i) All roots of (3.4) have negative real parts and the zero solution of system (3.1) is absolutely stable if \(d \geq 0\) and one of the following conditions is satisfied:

1. \(D_0 > 0\) and \(z_1^+ < 0\);
2. \(D_0 = 0\) and \(z_2^+ < 0\);
3. \(D_0 < 0\) and \(z_2^+ < 0\).
(ii) All roots of (3.4) have negative real parts and hence the zero solution of system (3.1) is asymptotically stable for $\tau \in [0, \tau_0]$ if $d < 0$ or $d \geq 0$ and one of the following conditions holds:

1. $D_0 > 0, z_1^* > 0$ and $h(z_1^*) < 0$;
2. $D_0 = 0, z_2^* > 0$ and $h(z_2^*) < 0$;
3. $D_0 < 0, z_3^* > 0$ and $h(z_3^*) < 0$.

(iii) $h(z)$ has at least a positive root $z_k$ and $\tau \in \{\tau_j^{(k)}\}, k = 1, 2, 3, 4; j = 0, 1, 2, \ldots$, are Hopf bifurcation values for system (3.1) if the conditions as stated in (ii) are satisfied and $h'(z_k) \neq 0$.

4. Direction and stability of the Hopf local bifurcation

In the above section, we have already obtained some sufficient conditions ensuring system (3.1) undergoes a Hopf bifurcation at the equilibrium $(0,0,0,0)$ when $\tau$ takes some certain critical values. In this section, we suppose that a Hopf bifurcation for system (3.1) will occur at the zero equilibrium when $\tau = \tau_j (j = 0, 1, 2, \ldots)$, that is, a family of periodic solutions bifurcate from the zero equilibrium and will establish the explicit formulae determining the direction, stability, and period of these periodic solutions bifurcating from the zero equilibrium at these critical values $\tau_j (j = 0, 1, 2, \ldots)$ of $\tau$ by using the normal theory and the center manifold argument developed by Hassard et al. [10]. Without loss of generality, we denote any one of these critical values $\tau = \tau_j (j = 0, 1, 2, \ldots)$ by $\tilde{\tau}$, at which (3.4) has a pair of purely imaginary roots $\pm i\omega$ and system (3.1) undergoes a Hopf bifurcation from the zero equilibrium.

Throughout this section, we make also the following for the conditions in (H$_1$):

(H$_3$) $f_k \in C^3(\mathbb{R}, \mathbb{R}), k = 1, 2, 3, 4$.

For the sake of simplicity, we denote $\tau$ as $\tau = \tilde{\tau} + \mu$, $\mu \in \mathbb{R}$. Then $\mu = 0$ is the Hopf bifurcation value of system (3.1). Let $y_k(t) = u_k(\tau t) (k = 1, 2, 3, 4)$. Then system (3.1) can be rewritten an functional differential equation in $C([-1, 0], \mathbb{R}^4)$ as

$$
\begin{align*}
\dot{y}_1(t) &= \tau [-\mu_1 y_1(t) + c_{21} f_1(y_2(t - 1)) + c_{31} f_1(y_3(t - 1)) + c_{41} f_1(y_4(t - 1))], \\
\dot{y}_2(t) &= \tau [-\mu_2 y_2(t) + c_{12} f_2(y_1(t))], \\
\dot{y}_3(t) &= \tau [-\mu_3 y_3(t) + c_{13} f_3(y_1(t))], \\
\dot{y}_4(t) &= \tau [-\mu_4 y_4(t) + c_{14} f_4(y_1(t))].
\end{align*}
$$

(4.1)

Let $y = (y_1, y_2, y_3, y_4)^T$ and substitute the Taylor expansion of $f_k (k = 1, 2, 3, 4)$ at the zero point into system (4.1), one can get the linearization of system (4.1) at the zero equilibrium $y = 0$ as

$$
\begin{align*}
\dot{y}_1(t) &= (\tilde{\tau} + \mu) [-\mu_1 y_1(t) + \alpha_{21} y_2(t - 1) + \alpha_{31} y_3(t - 1) + \alpha_{41} y_4(t - 1)], \\
\dot{y}_2(t) &= (\tilde{\tau} + \mu) [-\mu_2 y_2(t) + \alpha_{12} y_1(t)], \\
\dot{y}_3(t) &= (\tilde{\tau} + \mu) [-\mu_3 y_3(t) + \alpha_{13} y_1(t)], \\
\dot{y}_4(t) &= (\tilde{\tau} + \mu) [-\mu_4 y_4(t) + \alpha_{14} y_1(t)].
\end{align*}
$$

(4.2)
Rewrite (4.2) as the following matrix vector form:

\[ \dot{y}(t) = (\bar{\tau} + \mu)[B_0 y(t) + B_1 y(t-1)] = L_\mu(y_t), \quad (4.3) \]

where

\[
B_0 = \begin{bmatrix}
-\mu_1 & 0 & 0 & 0 \\
\alpha_{12} & -\mu_2 & 0 & 0 \\
\alpha_{13} & 0 & -\mu_3 & 0 \\
\alpha_{14} & 0 & 0 & -\mu_4
\end{bmatrix}, \quad B_1 = \begin{bmatrix}
0 & \alpha_{21} & \alpha_{31} & \alpha_{41} \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0
\end{bmatrix}. \quad (4.4)
\]

For any \( \phi = (\phi_1, \phi_2, \phi_3, \phi_4)^T \in C([-1, 0], \mathbb{R}^4), \)

\[ L_\mu(\phi) = (\bar{\tau} + \mu)[B_0 \phi(0) + B_1 \phi(-1)]. \quad (4.5) \]

Then \( L_\mu \) is a continuous linear function mapping \( C([-1, 0], \mathbb{R}^4) \) into \( \mathbb{R}^4. \) By the Rieze representation theorem, there exists a \( 4 \times 4 \) matrix function \( \eta(\theta, \mu), \) \(-1 \leq \theta \leq 0,\) whose elements are of bounded variation such that

\[ L_\mu(\phi) = \int_{-1}^{0} d\eta(\theta, \mu) \phi(\theta) \quad \text{for} \quad \phi \in C([-1, 0], \mathbb{R}^4). \quad (4.6) \]

In fact, we can choose

\[
\eta(\theta, \mu) = \begin{cases}
(\bar{\tau} + \mu)B_0, & \theta = 0, \\
0, & \theta \in (-1, 0), \\
-(\bar{\tau} + \mu)B_1, & \theta = -1.
\end{cases} \quad (4.7)
\]

Then (4.6) is satisfied.

For \( \phi \in C^1([-1, 0], \mathbb{R}^4), \) define the operator \( A(\mu) \) as

\[
A(\mu) \phi(\theta) = \begin{cases}
\frac{d\phi(\theta)}{d\theta}, & \theta \in [-1, 0), \\
L_\mu(\phi) \overset{\text{def}}{=} \int_{-1}^{0} d\eta(\xi, \mu) \phi(\xi), & \theta = 0.
\end{cases} \quad (4.8)
\]

For \( \phi = (\phi_1, \phi_2, \phi_3, \phi_4)^T \in C([-1, 0], \mathbb{R}^4), \) let

\[
f(\mu, \phi) = (\bar{\tau} + \mu) \begin{bmatrix}
k_1\phi_2^2(-1) + k_2\phi_2^3(-1) + k_3\phi_3^2(-1) + k_4\phi_3^3(-1) + \cdots \\
+k_5\phi_4^2(-1) + k_6\phi_4^3(-1) + \cdots \\
l_1\phi_1^2(0) + l_2\phi_1^3(0) + \cdots \\
m_1\phi_1^2(0) + m_2\phi_1^3(0) + \cdots \\
n_1\phi_1^2(0) + n_2\phi_1^3(0) + \cdots
\end{bmatrix}, \quad (4.9)
\]
where
\[
\begin{align*}
k_1 &= \frac{c_{21} f'''(0)}{2!}, & k_2 &= \frac{c_{21} f'''(0)}{3!}, & k_3 &= \frac{c_{31} f''(0)}{2!}, & k_4 &= \frac{c_{31} f'''(0)}{3!}, \\
k_5 &= \frac{c_{41} f''(0)}{2!}, & k_6 &= \frac{c_{41} f'''(0)}{3!}, & l_1 &= \frac{c_{12} f''(0)}{2!}, & l_2 &= \frac{c_{12} f''(0)}{3!}, \\
m_1 &= \frac{c_{13} f''(0)}{2!}, & m_2 &= \frac{c_{13} f''(0)}{3!}, & n_1 &= \frac{c_{14} f''(0)}{2!}, & n_2 &= \frac{c_{14} f''(0)}{3!}.
\end{align*}
\]

If we further define the operator \( R(\mu) \) as
\[
R(\mu) \phi(\theta) = \begin{cases} 0, & \theta \in [-1, 0), \\ f(\mu, \phi), & \theta = 0, \end{cases}
\]
then system (4.1) is equivalent to
\[
\dot{y}_t = A(\mu) y_t + R(\mu) y_t.
\]

For \( \psi \in C^1([0, 1], (\mathbb{R}^4)^*) \), define
\[
A^* \psi(s) = \begin{cases} -\frac{d\psi(s)}{ds}, & s \in (0, 1], \\ \int_{-1}^{0} \psi(-\xi) d\eta(\xi, 0), & s = 0, \end{cases}
\]
and a bilinear inner product
\[
\langle \psi(s), \phi(\theta) \rangle = \overline{\psi}(0) \phi(0) - \int_{-1}^{0} \int_{\xi=0}^{\theta} \overline{\psi}(\xi - \theta) d\eta(\theta) \phi(\xi) d\xi,
\]
where \( \eta(\theta) = \eta(\theta, 0) \). Then \( A(0) \) and \( A^* \) are adjoint operators.

From the discussion in Section 2, we know that \( \pm i\omega \tilde{\tau} \) are eigenvalues of \( A(0) \) and therefore they are also eigenvalues of \( A^* \). It is not difficult to verify the vector
\[
q(\theta) = \left( 1, \frac{\alpha_{12}}{\mu_2 + i\omega}, \frac{\alpha_{13}}{\mu_3 + i\omega}, \frac{\alpha_{14}}{\mu_4 + i\omega} \right)^T e^{i\omega \tilde{\tau} \theta}, \quad \theta \in [-1, 0]
\]
is the eigenvector of \( A(0) \) corresponding to the eigenvalue \( i\omega \tilde{\tau} \), and
\[
q^*(s) = Q \left( 1, \frac{\alpha_{21} e^{i\omega \tilde{\tau}}}{\mu_2 - i\omega}, \frac{\alpha_{31} e^{i\omega \tilde{\tau}}}{\mu_3 - i\omega}, \frac{\alpha_{41} e^{i\omega \tilde{\tau}}}{\mu_4 - i\omega} \right) e^{i\omega \tilde{\tau} s}, \quad s \in [0, 1],
\]
is the eigenvector of \( A^* \) corresponding to the eigenvalue \( -i\omega \tilde{\tau} \). Moreover, \( \langle q^*(s), q(\theta) \rangle = 1 \), where
\[
Q = \left( e^{-i\omega \tilde{\tau}} + \frac{\alpha_{12} \alpha_{21}}{(\mu_2 - i\omega)^2} + \frac{\alpha_{12} \alpha_{31}}{(\mu_2 - i\omega)(\mu_3 - i\omega)} + \frac{\alpha_{13} \alpha_{31}}{(\mu_3 - i\omega)^2} + \frac{\alpha_{14} \alpha_{41}}{(\mu_4 - i\omega)^2} + \frac{\alpha_{14} \alpha_{41}}{\mu_4 - i\omega} \right)^{-1} e^{-i\omega \tilde{\tau}}.
\]
Using the same notations as in Hassard et al. [10], we first compute the coordinates to describe the center manifold $C_0$ at $\mu = 0$. Let $y_t = (y_{1(t)}, y_{2(t)}, y_{3(t)}, y_{4(t)})^T$ be the solution of system (4.1) when $\mu = 0$. Define

$$z(t) = \langle q^*(s), y_t(\theta) \rangle,$$

$$W(t, \theta) = y_t(\theta) - 2\Re \{z(t)q(\theta)\}. \tag{4.19}$$

On the center manifold $C_0$, we have

$$W(t, \theta) = W(z(t), \bar{z}(t), \theta), \tag{4.20}$$

where

$$W(z, \bar{z}, \theta) = W_{20}(\theta) \frac{z^2}{2} + W_{11}(\theta)z\bar{z} + W_{02}(\theta) \frac{\bar{z}^2}{2} + W_{30}(\theta) \frac{z^3}{6} + \cdots, \tag{4.21}$$

$z$ and $\bar{z}$ are local coordinates for center manifold $C_0$ in the direction of $q$ and $q^*$. Note that $W$ is real if $y_t$ is real. We only consider real solution.

For solution $y_t \in C_0$ of system (4.1), we from (4.12) get $\dot{y}_t = A(0)y_t + R(0)y_t$ since $\mu = 0$. Therefore, from the definition of $R(\mu)$ and (4.19), we have

$$\dot{z}(t) = \langle q^*(s), \dot{y}_t \rangle = \langle q^*(s), A(0)y_t + R(0)y_t \rangle$$

$$= \langle q^*(s), A(0)y_t \rangle + \langle q^*(s), R(0)y_t \rangle$$

$$= \langle -i\omega\tilde{\tau}q^*(s), y_t \rangle + \overline{q^*(0)}f(0,y_t(\theta))$$

$$\overset{\text{def}}{=} i\omega\tilde{\tau}z(t) + \overline{q^*(0)}f_0(z(t), \bar{z}(t)). \tag{4.22}$$

We rewrite this as

$$\dot{z}(t) = i\omega\tilde{\tau}z(t) + g(z(t), \bar{z}(t)), \tag{4.23}$$

where

$$g(z, \bar{z}) = g_{20} \frac{z^2}{2} + g_{11} z\bar{z} + g_{02} \frac{\bar{z}^2}{2} + g_{21} \frac{z^2\bar{z}}{2} + \cdots. \tag{4.24}$$

For the sake of simplicity, let

$$\alpha = \frac{\alpha_{12}}{\mu_2 + i\omega}, \quad \beta = \frac{\alpha_{13}}{\mu_3 + i\omega}, \quad \gamma = \frac{\alpha_{14}}{\mu_4 + i\omega},$$

$$\alpha^* = \frac{\alpha_{21}e^{i\omega\tilde{\tau}}}{\mu_2 - i\omega}, \quad \beta^* = \frac{\alpha_{31}e^{i\omega\tilde{\tau}}}{\mu_3 - i\omega}, \quad \gamma^* = \frac{\alpha_{41}e^{i\omega\tilde{\tau}}}{\mu_4 - i\omega}. \tag{4.25}$$

Then (4.19) leads to

$$y_t(\theta) = W(t, \theta) + 2\Re \{z(t)q(\theta)\} = W(t, \theta) + z(t)q(\theta) + \bar{z}(t)\overline{q(\theta)}$$

$$= W_{20}(\theta) \frac{z^2}{2} + W_{11}(\theta)z\bar{z} + W_{02}(\theta) \frac{\bar{z}^2}{2} + (1, \alpha, \beta, \gamma)^T e^{i\omega\tilde{\tau}\theta}z + (1, \alpha^*, \beta^*, \gamma^*)^T e^{-i\omega\tilde{\tau}\theta}\bar{z} + \cdots. \tag{4.26}$$
Thus, we can easily obtain

\[
y^{(1)}(0) = W_{20}^{(1)}(0) \frac{z^2}{2} + W_{11}^{(1)}(0) z \bar{z} + W_{02}^{(1)}(0) \frac{z^2}{2} + z + \cdots,
\]

\[
y^{(2)}(-1) = W_{20}^{(2)}(-1) \frac{z^2}{2} + W_{11}^{(2)}(-1) z \bar{z} + W_{02}^{(2)}(-1) \frac{z^2}{2} + \alpha ze^{-i\omega \tau} + \bar{\alpha} ze^{i\omega \tau} + \cdots,
\]

\[
y^{(3)}(-1) = W_{20}^{(3)}(-1) \frac{z^2}{2} + W_{11}^{(3)}(-1) z \bar{z} + W_{02}^{(3)}(-1) \frac{z^2}{2} + \beta ze^{-i\omega \tau} + \bar{\beta} ze^{i\omega \tau} + \cdots,
\]

\[
y^{(4)}(-1) = W_{20}^{(4)}(-1) \frac{z^2}{2} + W_{11}^{(4)}(-1) z \bar{z} + W_{02}^{(4)}(-1) \frac{z^2}{2} + \gamma ze^{-i\omega \tau} + \bar{\gamma} ze^{i\omega \tau} + \cdots.
\]

(4.27)

Therefore, it follows from (4.9) that

\[
f_0(z(t), \bar{z}(t)) = \tilde{\tau} \left( 2 \left( k_1 |\alpha|^2 + k_3 |\beta|^2 + k_5 |\gamma|^2 \right) e^{-2i\omega \tau} \frac{z^2}{2} + 2 \left( k_1 |\alpha| |\beta| + k_3 |\beta| |\gamma| + k_5 |\gamma| |\gamma| \right) z \bar{z} \right.
\]

\[
+ 2 \left( k_1 \alpha^2 + k_3 \beta^2 + k_5 \gamma^2 \right) e^{2i\omega \tau} \frac{z^2}{2} \\
+ 2 \left[ \left( k_1 W_{20}^{(2)}(-1) \bar{\alpha} + k_3 W_{11}^{(2)}(-1) \bar{\beta} + k_5 W_{02}^{(2)}(-1) \bar{\gamma} \right) e^{i\omega \tau} \\
+ 2 \left( k_1 W_{11}^{(2)}(-1) \alpha + k_3 W_{20}^{(2)}(-1) \beta + k_5 W_{20}^{(2)}(-1) \gamma \right) e^{-i\omega \tau} \\
+ 2 \left( k_2 \bar{\alpha}^2 + k_4 \beta^2 \gamma + k_6 \gamma^2 \bar{\gamma} \right) e^{-2i\omega \tau} \frac{z^2}{2} \\
+ 2 \left( k_2 \bar{\alpha} \bar{\beta} + k_4 \beta \bar{\gamma} \gamma + k_6 \gamma \bar{\gamma} \right) e^{i\omega \tau} \frac{z^2}{2} \\
+ 2 \left[ \left( m_1 W_{20}^{(4)}(0) + 2 W_{11}^{(4)}(0) \right) + 3 \left[ l_1 z^2 + l_2 z \bar{z} + l_3 \bar{z}^2 \right] \frac{z^2}{2} \\
+ 2 \left[ m_1 z^2 + m_1 z \bar{z} + m_1 \bar{z}^2 \frac{z^2}{2} + \left[ m_1 \left( W_{20}^{(4)}(0) + 2 W_{11}^{(4)}(0) \right) + 3 m_2 \right] \frac{z^2}{2} \\
+ 2 \left[ m_1 z^2 + m_1 z \bar{z} + m_1 \bar{z}^2 \frac{z^2}{2} + \left[ n_1 \left( W_{20}^{(4)}(0) + 2 W_{11}^{(4)}(0) \right) + 3 n_2 \right] \frac{z^2}{2} \right] \right. \right)
\]

(4.28)

Thus one can obtain

\[
g(z, \bar{z}) = g_{20} \frac{z^2}{2} + g_{11} z \bar{z} + \frac{\bar{z}^2}{2} + g_{21} \frac{z^2 \bar{z}}{2} + \cdots
\]

\[
= q^* (0) f_0(z(t), \bar{z}(t))
\]

\[
= 2 \overline{Q} \left[ \left( k_1 |\alpha|^2 + k_3 |\beta|^2 + k_5 |\gamma|^2 \right) e^{-2i\omega \tau} + l_1 \bar{\alpha}^* + m_1 |\beta|^2 + n_1 |\gamma|^2 \right] \frac{z^2}{2}
\]

\[
+ 2 \overline{Q} \left[ \left( k_1 |\alpha|^2 + k_3 |\beta|^2 + k_5 |\gamma|^2 \right) e^{2i\omega \tau} + l_1 \bar{\alpha}^* + m_1 |\beta|^2 + n_1 |\gamma|^2 \right] z \bar{z}
\]

\[
+ 2 \overline{Q} \left[ \left( k_1 \bar{\alpha}^2 + k_3 \beta^2 + k_5 \gamma^2 \right) e^{i\omega \tau} + l_1 \bar{\alpha}^* + m_1 |\beta|^2 + n_1 |\gamma|^2 \right] \frac{z^2}{2}
\]
Comparing the coefficients of two sides of (4.29), we have

$$
g_{20} = 2\bar{Q}_{\tilde{r}} \left[ (k_1 \alpha^2 + k_3 \beta^2 + k_3 \gamma^2) e^{-2i\omega \tilde{r}} + l_1 \bar{\alpha}^* + m_1 \bar{\beta}^* + n_1 \bar{\gamma}^* \right],
$$

$$
g_{11} = 2\bar{Q}_{\tilde{r}} \left[ (k_1 |\alpha|^2 + k_3 |\beta|^2 + k_3 |\gamma|^2) + l_1 \bar{\alpha}^* + m_1 \bar{\beta}^* + n_1 \bar{\gamma}^* \right],
$$

$$
g_{02} = 2\bar{Q}_{\tilde{r}} \left[ (k_1 \alpha^2 + k_3 \beta^2 + k_3 \gamma^2) e^{2i\omega \tilde{r}} + l_1 \bar{\alpha}^* + m_1 \bar{\beta}^* + n_1 \bar{\gamma}^* \right],
$$

$$
g_{21} = 2\bar{Q}_{\tilde{r}} \left\{ (k_1 W_{20}^{(2)}(-1) \bar{\alpha} + k_3 W_{20}^{(3)}(-1) \bar{\beta} + k_5 W_{20}^{(4)}(-1) \bar{\gamma}) e^{i\omega \tilde{r}} \right. \\
+ 2(1 + k_1 W_{11}^{(2)}(-1) \bar{\alpha} + k_3 W_{11}^{(3)}(-1) \bar{\beta} + k_5 W_{11}^{(4)}(-1) \bar{\gamma}) e^{-i\omega \tilde{r}} \\
+ 3(k_2 \bar{\alpha}^2 \bar{\alpha} + k_4 \bar{\beta}^2 \bar{\beta} + k_6 \bar{\gamma}^2 \bar{\gamma}) e^{-i\omega \tilde{r}} + \bar{\alpha}^* \left[ l_1 \left( W_{20}^{(1)}(0) + 2W_{11}^{(1)}(0) \right) + 3l_2 \right] \\
+ \bar{\beta}^* \left[ m_1 \left( W_{20}^{(1)}(0) + 2W_{11}^{(1)}(0) \right) + 3m_2 \right] + \bar{\gamma}^* \left[ n_1 \left( W_{20}^{(1)}(0) + 2W_{11}^{(1)}(0) \right) + 3n_2 \right] \right\}.
$$

Since $W_{20}(\theta)$ and $W_{11}(\theta)$ for $\theta \in [-1,0]$ appear in $g_{21}$, we still need to compute them. From (4.12), (4.19), and (4.22), we have

$$
W = \dot{z}_t - 2 \text{Re} \{ \dot{z}(t) q(\theta) \} = \begin{cases} 
A(0) W(t, \theta) - 2 \text{Re} \{ \bar{q}^* (0) f_0(z(t), \bar{z}(t)) q(\theta) \}, & \theta \in [-1,0), \\
A(0) W(t, \theta) - 2 \text{Re} \{ \bar{q}^* (0) f_0(z(t), \bar{z}(t)) q(0) \} + f_0(z(t), \bar{z}(t)), & \theta = 0,
\end{cases}
$$

where

$$
H(z, \bar{z}, \theta) = H_{20}(\theta) \frac{\bar{q}^2}{2} + H_{11}(\theta) z \bar{z} + H_{02}(\theta) \frac{\bar{q}^2}{2} + \cdots.
$$
From (4.31) and (4.32), we have

$$A(0) W(t, \theta) - \dot{W} = -H(z, \bar{z}, \theta) = -H_{20}(\theta) \frac{z^2}{2} - H_{11}(\theta) z \bar{z} - H_{02}(\theta) \frac{\bar{z}^2}{2} - \cdots. \quad (4.33)$$

In view of (4.21), one can obtain

$$A(0) W(t, \theta) = A(0) W_{20}(\theta) \frac{z^2}{2} + A(0) W_{11}(\theta) z \bar{z} + \cdots, \quad (4.34)$$

$$\dot{W} = W z \dot{z} + W \bar{z} \dot{\bar{z}} = 2i\omega \tau W_{20}(\theta) \frac{z^2}{2} + \cdots. \quad (4.35)$$

It follows from (4.34) that

$$A(0) W(t, \theta) - \dot{W} = [A(0) - 2i\omega \tau I] W_{20}(\theta) \frac{z^2}{2} + A(0) W_{11}(\theta) z \bar{z} + \cdots. \quad (4.36)$$

Thus, (4.33) and (4.35) imply that

$$[A(0) - 2i\omega \tau I] W_{20}(\theta) \frac{z^2}{2} + A(0) W_{11}(\theta) z \bar{z} + \cdots = -H_{20}(\theta) \frac{z^2}{2} - H_{11}(\theta) z \bar{z} - H_{02}(\theta) \frac{\bar{z}^2}{2} - \cdots. \quad (4.37)$$

Comparing the coefficients of two sides of (4.36), we have

$$[A(0) - 2i\omega \tau I] W_{20}(\theta) = -H_{20}(\theta), \quad A(0) W_{11}(\theta) = -H_{11}(\theta), \ldots. \quad (4.38)$$

From (4.31), we know that for $\theta \in [-1, 0)$,

$$H(z, \bar{z}, \theta) = -2 \text{Re} \left\{ \bar{q}^* (0) f_0 (z(t), \bar{z}(t)) q(\theta) \right\}$$

$$= -\bar{q}^* (0) f_0 (z(t), \bar{z}(t)) q(\theta) - q^* (0) \overline{f_0 (z(t), \bar{z}(t))} \bar{q}(\theta)$$

$$= -g(z, \bar{z}) q(\theta) - \overline{g(z, \bar{z})} \bar{q}(\theta)$$

$$= -(g_{20} q(\theta) + \overline{g_{02} q(\theta)}) \frac{z^2}{2} - (g_{11} q(\theta) + \overline{g_{11} q(\theta)}) z \bar{z} + \cdots. \quad (4.39)$$

Comparing the coefficients with (4.32) gives that

$$H_{20}(\theta) = -(g_{20} q(\theta) + \overline{g_{02} q(\theta)}), \quad (4.40)$$

$$H_{11}(\theta) = -(g_{11} q(\theta) + \overline{g_{11} q(\theta)}). \quad (4.41)$$

From (4.37), (4.39) and the definition of $A(0)$, we have

$$\dot{W}_{20}(\theta) = 2i\omega \tau W_{20}(\theta) + g_{20} q(\theta) + \overline{g_{02} q(\theta)}. \quad (4.42)$$
Note that $q(\theta) = q(0)e^{i\omega\tilde{\tau}\theta}$, hence
\[
W_{20}(\theta) = \frac{ig_{20}}{\omega\tilde{\tau}} q(\theta) + \frac{ig_{02}}{3\omega\tilde{\tau}} \overline{q}(\theta) + E_1 e^{2i\omega\tilde{\tau}\theta}. \tag{4.42}
\]

Similarly, from (4.37), (4.40), and the definition of $A(0)$, we have
\[
\dot{W}_{11}(\theta) = g_{11} q(\theta) + \overline{g}_{11} \overline{q}(\theta),
\]
\[
W_{11}(\theta) = - \frac{ig_{11}}{\omega\tilde{\tau}} q(\theta) + \frac{ig_{11}}{3\omega\tilde{\tau}} \overline{q}(\theta) + E_2. \tag{4.43}
\]

In what follows, we will seek appropriate $E_1$ and $E_2$ in (4.42) and (4.43), respectively. It follows from the definition of $A(0)$ and (4.37) that
\[
\int_{-1}^{0} d\eta(\theta)W_{20}(\theta) = 2i\omega\tilde{\tau}W_{20}(0) - H_{20}(0), \tag{4.44}
\]
\[
\int_{-1}^{0} d\eta(\theta)W_{11}(\theta) = -H_{11}(0). \tag{4.45}
\]

Note that $q(\theta)$ is the eigenvector of $A(0)$ and from (4.42) and the definition of $A(0)$, we know that
\[
\int_{-1}^{0} d\eta(\theta)W_{20}(\theta) = -g_{20} q(0) + \frac{ig_{02}}{3} \overline{q}(0) + \int_{-1}^{0} d\eta(\theta)e^{2i\omega\tilde{\tau}\theta}E_1,
2i\omega\tilde{\tau}W_{20}(0) = -2g_{20} q(0) - \frac{2ig_{02}}{3} \overline{q}(0) + 2i\omega\tilde{\tau}E_1. \tag{4.46}
\]

Thus, (4.44) becomes
\[
-g_{20} q(0) - \overline{g}_{02} \overline{q}(0) + \left(2i\omega\tilde{\tau}I - \int_{-1}^{0} d\eta(\theta)e^{2i\omega\tilde{\tau}\theta}\right)E_1 = H_{20}(0). \tag{4.47}
\]

Similarly, from (4.43), we have
\[
\int_{-1}^{0} d\eta(\theta)W_{11}(\theta) = g_{11} q(0) + \overline{g}_{11} \overline{q}(0) + \int_{-1}^{0} d\eta(\theta)E_2. \tag{4.48}
\]

Hence (4.45) becomes
\[
-(g_{11} q(0) + \overline{g}_{11} \overline{q}(0)) - \int_{-1}^{0} d\eta(\theta)E_2 = H_{11}(0). \tag{4.49}
\]

From (4.31) and (4.32), we know that
\[
H(z, \overline{z}, 0) = H_{20}(0) \frac{z^2}{2} + H_{11}(0)z\overline{z} + H_{02}(0) \frac{\overline{z}^2}{2} + \cdots
\]
\[
= -2\operatorname{Re}\{\overline{q}^+(0)f_0(z(t), \overline{z}(t))q(0)\} + f_0(z(t), \overline{z}(t))
\]
\[
= -(g_{20} q(0) + \overline{g}_{02} \overline{q}(0)) \frac{z^2}{2} - (g_{11} q(0) + \overline{g}_{11} \overline{q}(0))z\overline{z} + f_0(z(t), \overline{z}(t)) + \cdots. \tag{4.50}
\]
It follows together with (4.28) that

\begin{align*}
H_{20}(0) &= -(g_{20}q(0) + \mathcal{G}_{02}q(0)) + 2\tilde{\tau}h_{20}, \\
H_{11}(0) &= -(g_{11}q(0) + \mathcal{G}_{11}q(0)) + 2\tilde{\tau}h_{11},
\end{align*}

where

\begin{align*}
   h_{20} &= ((k_1\alpha^2 + k_3\beta^2 + k_5y^2)e^{-2i\omega\tilde{\tau}}, l_1, m_1, n_1)^T, \\
   h_{11} &= (k_1|\alpha|^2 + k_3|\beta|^2 + k_5|y|^2, l_1, m_1, n_1)^T.
\end{align*}

Substituting (4.51) into (4.47), we obtain

\begin{equation}
\left(2i\omega\tilde{\tau}I - \int_{-1}^{0} d\eta(\theta)e^{2i\omega\tilde{\tau}\theta}\right)E_1 = 2\tilde{\tau}h_{20},
\end{equation}

that is,

\begin{equation}
\begin{bmatrix}
2i\omega + \mu_1 & -\alpha_{21}e^{-2i\omega\tilde{\tau}} & -\alpha_{31}e^{-2i\omega\tilde{\tau}} & -\alpha_{41}e^{-2i\omega\tilde{\tau}} \\
-\alpha_{12} & 2i\omega + \mu_2 & 0 & 0 \\
-\alpha_{13} & 0 & 2i\omega + \mu_3 & 0 \\
-\alpha_{14} & 0 & 0 & 2i\omega + \mu_4
\end{bmatrix}E_1 = 2h_{20}.
\end{equation}

Solving this equation, one can obtain $E_1$.

Similarly, substituting (4.52) into (4.48), we get

\begin{equation}
\int_{-1}^{0} d\eta(\theta)E_2 = -2\tilde{\tau}h_{11},
\end{equation}

which means that

\begin{equation}
\begin{bmatrix}
\mu_1 & -\alpha_{21} & -\alpha_{31} & -\alpha_{41} \\
-\alpha_{12} & \mu_2 & 0 & 0 \\
-\alpha_{13} & 0 & \mu_3 & 0 \\
-\alpha_{14} & 0 & 0 & \mu_4
\end{bmatrix}E_2 = 2h_{11}.
\end{equation}

From this equation, we can get $E_2$.

Consequently, $g_{21}$ can be expressed explicitly. Thus, we can compute the following values:

\begin{align*}
   c_1(0) &= \frac{i}{2\omega\tilde{\tau}} \left( g_{11}g_{20} - 2|g_{11}|^2 - \frac{|g_{02}|^2}{3} \right) + \frac{g_{21}}{2}, \\
   g_2 &= -\frac{\text{Re} (c_1(0))}{\text{Re} (\lambda'_k(\tau_j))}, \quad \varsigma_2 = 2\text{Re} (c_1(0)), \\
   T_2 &= -\frac{\text{Im} (c_1(0)) + \varsigma_2 \text{Im} (\lambda'_k(\tau_j))}{\omega}, \quad j = 0, 1, 2, \ldots,
\end{align*}

which determine the properties of bifurcating periodic solutions at the critical value $\tau_j$, that is, $g_2$ determines the directions of the Hopf bifurcation: if $g_2 > 0$ ($g_2 < 0$), then the
Hopf bifurcation is supercritical (subcritical) and the bifurcating periodic solutions exist for \( \tau > \tau_1 \) (\( \tau < \tau_1 \)); \( \zeta_2 \) determines the stability of the bifurcating periodic solutions: the bifurcating periodic solutions on the center manifold are stable (unstable) if \( \zeta_2 < 0 \) (\( \zeta_2 > 0 \)); and \( T_2 \) determines the period of the bifurcating periodic solutions: the period increases (decreases) if \( T_2 > 0 \) (\( T_2 < 0 \)).

5. Applications and numerical simulations

In this section, we will apply the results obtained in Sections 3 and 4 to investigate a special four-neuron BAM neural network with two delays and give numerical simulations supporting our theoretical analysis.

5.1. Application to a special BAM neural network. Consider the four-neuron BAM neural network with two delays described by the following functional differential equations:

\[
\begin{align*}
\dot{x}_1(t) &= -\mu x_1(t) + c_{21} f(x_2(t - \tau_2)) + c_{31} f(x_3(t - \tau_2)) + c_{41} f(x_4(t - \tau_2)), \\
\dot{x}_2(t) &= -\mu x_2(t) + c_{12} f(x_1(t - \tau_1)), \\
\dot{x}_3(t) &= -\mu x_3(t) + c_{13} f(x_1(t - \tau_1)), \\
\dot{x}_4(t) &= -\mu x_4(t) + c_{14} f(x_1(t - \tau_1)),
\end{align*}
\]

with \( \mu > 0, c_{k1} (k = 2, 3, 4) > 0 \), and \( c_{ll} (l = 2, 3, 4) < 0 \). In addition, the activation function \( f \) satisfies the following condition:

\((H_4) \) \( f \in C^3(\mathbb{R}, \mathbb{R}), f(0) = 0, f''(0) \neq 0, f'''(0) = 0 \) and \( f''''(0) \neq 0 \).

For instance, the nonlinear activation function commonly used in the studies and applications on neural network given by \( f(u) = \tanh(u) \) possesses the above property. Adopting the same notations as in Sections 3 and 4, for system (5.1), we have

\[
\alpha_{k1} = c_{k1} f'(0), \quad \alpha_{ll} = c_{ll} f'(0), \quad k, l = 2, 3, 4.
\]

From (3.5) and (3.6), one can get that

\[
\begin{align*}
a_3 &= 4\mu > 0, \quad a_2 = 6\mu^2 > 0, \quad a_1 = 4\mu^3 > 0, \quad a_0 = \mu^4 > 0, \\
b_2 &= -(c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41}) f''(0) > 0, \\
b_1 &= -2\mu (c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41}) f''(0) > 0, \\
b_0 &= -\mu^2 (c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41}) f''(0) > 0,
\end{align*}
\]

which implies the condition \((H_2)\) holds and \( a, b, c, d \) defined by (3.6) are

\[
\begin{align*}
a &= 4\mu^2, \quad b &= 6\mu^4 - (c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41})^2 f''(0), \\
c &= 4\mu^6 - 2\mu^2 (c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41})^2 f''(0), \\
d &= \mu^8 - \mu^4 (c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41})^2 f''(0).
\end{align*}
\]
Therefore, we have \( b > 0, c > 0, d < 0 \) provided that
\[
\mu^4 < (c_{12}c_{21} + c_{13}c_{31} + c_{14}c_{41})^2 f^{(4)}(0) < 2\mu^4. \tag{5.5}
\]
Thus, \( dh(z)/dz > 0 \) for all \( z > 0 \), that is, \( h(z) \) is strictly monotonous increasing on \([0, \infty)\). Noticing that \( d < 0 \), it follows that \( h(z) \) has only a positive root, say \( z_0 \). Let \( \omega_0 = \sqrt{z_0} \), \( \tau = \tau_1 + \tau_2 \). From (2.16) and (5.3), we have
\[
\tau_j = \frac{1}{\omega_0} \left\{ \arccos \left( \frac{\mu^2 - \omega_0^2}{(c_{12}c_{21} + c_{13}c_{31} + c_{14}c_{41}) f^{(2)}(0)} \right) + 2j\pi \right\}, \quad j = 0, 1, \ldots \tag{5.6}
\]
By Theorem 3.1, we can get the following result.

**Theorem 5.1.** Suppose that the condition \((H_4)\) and (5.5) hold and \( \tau_j \) is defined by (5.6).

(i) When \( \tau \in [0, \tau_0) \), all roots of the corresponding characteristic equation of (5.1) have negative real parts. Meanwhile, when \( \tau = \tau_0 \), the corresponding characteristic equation of (5.1) has only a pair of simple purely imaginary roots \( \pm i\omega_0 \), and all other roots have negative real parts. However, when \( \tau > \tau_0 \), the corresponding characteristic equation of (5.1) has at least one root with positive real part.

(ii) The zero steady state of system (5.1) is asymptotically stable when \( \tau \in [0, \tau_0) \), and unstable when \( \tau > \tau_0 \).

(iii) System (5.1) undergoes a Hopf bifurcation at the zero steady state when \( \tau = \tau_j, \ j = 0, 1, 2, \ldots \).

**Theorem 5.2.** Assume the conditions of Theorem 5.1 hold, and \( \tau_j \) is defined by (5.6). Then, the direction of Hopf bifurcation and stability of the bifurcating periodic solutions at \( \tau_j \) \( (j = 0, 1, 2, \ldots) \) are determined by sign of \( f^{(3)}(0)/f'(0) \). More specifically, if \( f^{(3)}(0)/f'(0) < 0 \ (> 0) \), then the Hopf bifurcation is supercritical (subcritical) and the bifurcating periodic solutions are orbitally asymptotically stable (unstable) on the center manifold.

**Proof.** For system (5.1), from the assumption \((H_4)\), we know that
\[
\begin{align*}
 k_1 &= \frac{c_{21}f''(0)}{2!} = 0, & k_2 &= \frac{c_{21}f'''(0)}{3!}, & k_3 &= \frac{c_{31}f''(0)}{2!} = 0, \\
 k_4 &= \frac{c_{31}f'''(0)}{3!}, & k_5 &= \frac{c_{41}f''(0)}{2!} = 0, & k_6 &= \frac{c_{41}f'''(0)}{3!}, \\
 l_1 &= \frac{c_{12}f''(0)}{2!} = 0, & l_2 &= \frac{c_{12}f'''(0)}{3!}, & m_1 &= \frac{c_{13}f''(0)}{2!} = 0, \\
 m_2 &= \frac{c_{13}f'''(0)}{3!}, & n_1 &= \frac{c_{14}f''(0)}{2!} = 0, & n_2 &= \frac{c_{14}f'''(0)}{3!}, \\
 \alpha &= \frac{c_{12}f'(0)}{\mu + i\omega_0}, & \beta &= \frac{c_{13}f'(0)}{\mu + i\omega_0}, & \gamma &= \frac{c_{14}f'(0)}{\mu + i\omega_0}, \\
 \alpha^* &= \frac{c_{21}f'(0)}{\mu - i\omega_0} e^{i\omega_0\tau_j}, & \beta^* &= \frac{c_{31}f'(0)}{\mu - i\omega_0} e^{i\omega_0\tau_j}, & \gamma^* &= \frac{c_{41}f'(0)}{\mu - i\omega_0} e^{i\omega_0\tau_j}. & \tag{5.7}
\end{align*}
\]
From (5.7) and (4.30), we can observe

\[ g_{20} = g_{11} = g_{02} = 0, \]

\[ g_{21} = 6 \mathcal{Q}_j \left( k_2 \alpha^2 \bar{\alpha} + k_4 \beta^2 \bar{\beta} + k_6 \gamma^2 \bar{\gamma} \right) e^{-i\omega_0 \tau_j} + l_2 \bar{\alpha}^\ast + m_2 \bar{\beta}^\ast + n_2 \bar{\gamma}^\ast \]

\[ = \frac{c_{12} c_{21} (|\alpha|^2 + 1) + c_{13} c_{31} (|\beta|^2 + 1) + c_{14} c_{41} (|\gamma|^2 + 1)}{\mu + i\omega_0} \times \mathcal{Q}_j f''(0) f'''(0) e^{-i\omega_0 \tau_j}. \]  

(5.8)

From the discussion in Section 4, we know that

\[ (\mu + i\omega_0)^2 = \frac{1}{3} (\alpha_{12} \alpha_{21} + \alpha_{13} \alpha_{31} + \alpha_{14} \alpha_{41}) e^{-i\omega_0 \tau_j}. \]  

(5.9)

Therefore, we have

\[ \mathcal{Q} = \left[ e^{i\omega_0 \tau_j} + \frac{\alpha_{12} \alpha_{21} + \alpha_{13} \alpha_{31} + \alpha_{14} \alpha_{41}}{(\mu + i\omega_0)^2} + \frac{(\alpha_{12} \alpha_{21} + \alpha_{13} \alpha_{31} + \alpha_{14} \alpha_{41}) \tau_j}{\mu + i\omega_0} \right]^{-1} e^{i\omega_0 \tau_j}, \]

\[ = \frac{(\mu + i\omega_0)^2 e^{i\omega_0 \tau_j}}{(\mu + i\omega_0)^2 e^{i\omega_0 \tau_j} + (\alpha_{12} \alpha_{21} + \alpha_{13} \alpha_{31} + \alpha_{14} \alpha_{41}) \left[ 1 + (\mu + i\omega_0) \tau_j \right]} \]

\[ = \frac{3 (\mu + i\omega_0)^2 e^{i\omega_0 \tau_j}}{(c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41}) (4 + 3 \mu \tau_j + i 3 \omega_0 \tau_j) f''(0)}. \]  

(5.10)

Substituting (5.10) into (5.8), one can get

\[ g_{21} = 3 \tau_j \frac{f'''(0)}{f''(0)} \frac{\mu (4 + 3 \mu \tau_j) + 3 \omega_0 \tau_j + 4 \omega_0 i}{(c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41}) \left( (4 + 3 \mu \tau_j)^2 + 9 \omega_0^2 \right)} \times [c_{12} c_{21} (|\alpha|^2 + 1) + c_{13} c_{31} (|\beta|^2 + 1) + c_{14} c_{41} (|\gamma|^2 + 1)]. \]  

(5.11)

Noticing that \( g_{20} = g_{11} = g_{02} = 0 \) and from (4.58), we have

\[ \text{Re} \{ c_1(0) \} = \frac{1}{2} \text{Re} \{ g_{21} \} \]

\[ = 3 \tau_j \frac{f'''(0)}{2 f''(0)} \frac{\mu (4 + 3 \mu \tau_j) + 3 \omega_0 \tau_j}{(c_{12} c_{21} + c_{13} c_{31} + c_{14} c_{41}) \left( (4 + 3 \mu \tau_j)^2 + 9 \omega_0^2 \right)} \times [c_{12} c_{21} (|\alpha|^2 + 1) + c_{13} c_{31} (|\beta|^2 + 1) + c_{14} c_{41} (|\gamma|^2 + 1)]. \]  

(5.12)
In addition, when \( \mu^4 < (c_{12}c_{21} + c_{13}c_{31} + c_{14}c_{41})^2f''(0) < 2\mu^4 \), we know that \( a > 0, b > 0, c > 0 \), it follows that \( dh(z)/dz > 0 \) for all \( z \geq 0 \). Therefore, we have \( \text{Re}\{\lambda'(\tau_j)\} > 0 \). Noticing that \( \mu, \omega_0, \tau_j > 0 \) (\( j = 0, 1, 2, \ldots \)), \( a_{k1} > 0 \) (\( k = 2, 3, 4 \)), and \( a_{1l} < 0 \) (\( l = 2, 3, 4 \)), we can easily obtain

\[
\begin{align*}
\xi_2 &= -\frac{\text{Re}\{c_1(0)\}}{\text{Re}\{\lambda'(\tau_j)\}} > 0 (< 0) \quad \text{if } f''(0)/f'(0) < 0 (> 0), \\
\eta_2 &= 2\text{Re}\{c_1(0)\} < (>) 0 \quad \text{if } f''(0)/f'(0) < 0 (> 0).
\end{align*}
\]

By the general result of Hassard et al. [10], the conclusion of the theorem follows. \( \square \)

### 5.2. Numerical simulations

In this section, we give numerical simulations supporting our theoretical analysis. As an example, we consider the following system:

\[
\begin{align*}
\dot{x}_1(t) &= -2x_1(t) + 2\tanh(x_2(t - \tau_2)) + \tanh(x_3(t - \tau_2)) + \tanh(x_4(t - \tau_2)), \\
\dot{x}_2(t) &= -2x_2(t) - \tanh(x_1(t - \tau_1)), \\
\dot{x}_3(t) &= -2x_3(t) - 2\tanh(x_1(t - \tau_1)), \\
\dot{x}_4(t) &= -2x_4(t) - \tanh(x_1(t - \tau_1)),
\end{align*}
\]

which has an equilibrium \((0,0,0,0)\). It follows from (5.4) that \( a = 16, b = 71, c = 56, d = -144 \) since \( f''(0) = \tanh'(0) = 1 \). Thus, in this case \( h(z) = z^4 + 16z^3 + 71z^2 + 56z - 144 \), it is easily to see that equation \( h(z) = 0 \) has only a positive root \( z_0 = 1 \), and so \( \omega_0 = 1 \). From (5.6), we have

\[
\tau_j = \arccos\left(-\frac{3}{5}\right) + 2j\pi, \quad j = 0, 1, \ldots,
\]

where \( \tau_j = \tau_{j1} + \tau_{j2} \). From Theorem 5.1, we know that the zero equilibrium of system (5.14) is asymptotically stable when \( \tau_1 + \tau_2 \in [0,2.2143] \), this fact is illustrated by the numerical simulation in Figures 5.1-5.2 with \( \tau_1 = 1.2, \tau_2 = 0.8 \).

When \( \tau_1 + \tau_2 \) is increased to the critical value 2.2143, the origin loses its stability and Hopf bifurcation occurs. In addition, since \( f'''(0) = \tanh'''(0) = -1/4 \), it follows from Theorem 5.2 that the Hopf bifurcation is supercritical and the projection of the bifurcating periodic solution on the center manifold is asymptotically stable, that is, the bifurcating periodic solution is orbitally asymptotically stable. In addition, all roots of (2.5) with \( \tau = \tau_0 = 2.2143 \), except \( \pm i \), have negative real parts. Thus, the center manifold theory implies that the stability of the periodic solutions projected in the center manifold coincide with the stability of the periodic solutions in the whole phase space, this property is depicted in the numerical simulation Figures 5.3, 5.4, and 5.5 with \( \tau_1 = 1.2, \tau_2 = 1.3 \).
Figure 5.1. The trajectories graphs of system (5.14) with $\tau_1 = 1.2$, $\tau_2 = 0.8$, and initial data $x_1(t) = x_2(t) = x_3(t) = x_4(t) = 0.3$, $t \in [-1.2, 0]$. 

Figure 5.2. The projections in the space with dimension 3 of the orbit of system (5.14) with $\tau_1 = 1.2$, $\tau_2 = 0.8$, and initial data $x_1(t) = x_2(t) = x_3(t) = x_4(t) = 0.3$, $t \in [-1.2, 0]$. 

Figure 5.3. The trajectories graphs of system (5.14) with $\tau_1 = 1.2$, $\tau_2 = 1.3$, and initial data $x_1(t) = x_2(t) = x_3(t) = x_4(t) = 0.3$, $t \in [-1.3, 0]$.

Figure 5.4. The trajectories graphs of system (5.14) with $\tau_1 = 1.2$, $\tau_2 = 1.3$, and initial data $x_1(t) = x_2(t) = x_3(t) = x_4(t) = 0.09$, $t \in [-1.3, 0]$. 
Figure 5.5. The projections in three-dimensional spaces of the orbit of system (5.14) with $\tau_1 = 1.2$, $\tau_2 = 1.3$, and initial data $x_1(t) = x_2(t) = x_3(t) = x_4(t) = 0.3$, 0.09, $t \in [-1.3, 0]$.

Special Issue on
Modeling Experimental Nonlinear Dynamics and Chaotic Scenarios

Call for Papers

Thinking about nonlinearity in engineering areas, up to the 70s, was focused on intentionally built nonlinear parts in order to improve the operational characteristics of a device or system. Keying, saturation, hysteretic phenomena, and dead zones were added to existing devices increasing their behavior diversity and precision. In this context, an intrinsic nonlinearity was treated just as a linear approximation, around equilibrium points.

Inspired on the rediscovering of the richness of nonlinear and chaotic phenomena, engineers started using analytical tools from “Qualitative Theory of Differential Equations,” allowing more precise analysis and synthesis, in order to produce new vital products and services. Bifurcation theory, dynamical systems and chaos started to be part of the mandatory set of tools for design engineers.

This proposed special edition of the Mathematical Problems in Engineering aims to provide a picture of the importance of the bifurcation theory, relating it with nonlinear and chaotic dynamics for natural and engineered systems. Ideas of how this dynamics can be captured through precisely tailored real and numerical experiments and understanding by the combination of specific tools that associate dynamical system theory and geometric tools in a very clever, sophisticated, and at the same time simple and unique analytical environment are the subject of this issue, allowing new methods to design high-precision devices and equipment.

Authors should follow the Mathematical Problems in Engineering manuscript format described at http://www.hindawi.com/journals/mpe/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
