A NOTE ON INFLUENCE OF SUBGROUP RESTRICTIONS
IN FINITE GROUP STRUCTURE

ABSTRACT. The structure of a finite group under specific restrictions respectively on
its maximal, minimal and prime power subgroups has been investigated in this paper.

KEY WORDS AND PHRASES. Maximal subgroup, minimal subgroup, Frobenius Kernel,
Supersolvable, nilpotent.

1. INTRODUCTION.

We consider in this note group theoretic restrictions on specific subgroups of a
finite group G. These restrictions yield different characterizations of G. All the
groups considered in this note are finite. We shall use a result due to R. Baer [1,
Lemma 3, pp. 12] in proving Theorem 1 and we state it below for the sake of
completeness.

LEMMA 1. If the group G possesses a maximal subgroup with core 1 then the
following properties of G are equivalent.

(1) The indices in G of all the maximal subgroups with core 1 are powers of one
and the same prime p.

(2) There exists one and only one minimal normal subgroup of G, and there exists
a common prime divisor of all the indices in G of all the maximal subgroups with core
1.

(3) There exists a soluble normal subgroup, not 1, in G.
2. GENERAL RESULTS.

THEOREM 1. If the indices of all non-normal maximal subgroups of a group \( G \) are equal then \( G \) is solvable.

PROOF. If for some maximal subgroup \( M \) of \( G \), \([G:M] \neq 1\) for some prime \( p \) then there exists however a maximal subgroup \( M' \) such that \([G:M'] = 1\). Therefore \( G \) is not simple and by induction \( G/N \) is solvable and \( N \) is unique. If \( N \subseteq \Phi(G) \) then \( G = XN \) for some maximal subgroup \( X \) of \( G \) and \( X \) is core free. Since the indices of all core free maximal subgroups are same it now follows by Lemma 1 that \( N \) is solvable which implies \( G \) is solvable.

PROPOSITION 1. If a non abelian group \( G \) has a maximal subgroup \( M \) whose intersection with any other maximal subgroup is trivial then \( G \) must be elementary abelian by cyclic, \( G \) is an SBP (Sylow best possible) group and matches the description of Theorem 2.2 [5].

PROOF. If \( M \) is the only maximal subgroup of \( G \) then \( G \) is cyclic and also note that \( G \) cannot be a \( p \)-group either. For if \( M \) and \( M' \) are two maximal subgroups of \( G \) then each one of them is normal in \( G \) and \( |M_1| = |M| = p^{n-1} \) if \( |G| = p^n \). This implies \( |G| = p^n = |M_1||M| = p^{2n-2} \), i.e. \( N = 2 \) and \( G \) is abelian. Now \( M \cap M' = \langle \phi \rangle \Psi \) in \( G \) implies \( G = FM, F \cap M = \langle \phi \rangle \) where \( F \) is the Frobenius Kernel. Consequently \( F \) is elementary abelian for some prime \( p \). If \( M_0 \) is a maximal subgroup of \( M \) then \( FM_0 \) is also a maximal subgroup of \( G \) and hence \( G = FM_0 \), \( |\langle \phi \rangle| = q \), a prime.

The location of the prime ordered elements and elements of order 4 in the center of a group \( G \) imply that \( G \) is nilpotent. This theorem is due to N. Ito (Theorem 5.5, pp. 435 [2]). The following theorem is a dual of Ito's result.

THEOREM 2. A non abelian group \( G \) in which every minimal subgroup is self centralizing is a group of order \( p^q \), \( p, q \) different primes.

PROOF. Let \( x \) be an element of \( G \) such that \( |x| = p^n \), the smallest prime divisor of \( |G| \). If an element \( y \) normalizes \( \langle x \rangle \) then \( y, y_i \) also normalizes \( \langle x \rangle \) where \( \langle y \rangle = \langle y_1 \rangle \times \langle y_2 \rangle \times \ldots \times \langle y_n \rangle \), \( |y_i| = p_i, p_i \) a prime. Therefore \( \langle y \rangle \langle x \rangle = \langle x \rangle \langle y \rangle \) is supersolvable and so \( \langle y \rangle \langle y_i \rangle \) centralizes \( x, 1 \leq i \leq n-1 \). In \( \langle y \rangle \langle x \rangle = \langle x \rangle \langle y \rangle = H \), \( \langle y_n \rangle \) is a maximal subgroup and consequently is normal in \( H \). (If \( \langle x \rangle \subseteq \langle y \rangle \) then of course \( y_n \) trivially centralizes \( x \)). It follows that \( y_n \) and \( x \) centralize each other and we therefore conclude \( \langle x \rangle \cap \langle y \rangle \subseteq \langle x \rangle \) in \( G \). Thus \( G = F \langle x \rangle, F \langle x \rangle = \langle e \rangle, F \) is the Frobenius Kernel. Evidently \( |F| \) is divisible by one prime and \( F = \langle y \rangle \), \( |\langle y \rangle| \) a prime power.

PROPOSITION 2. If the order of a group \( G \) is divisible by at least two primes and every proper subgroup is of prime power order then \( G \) is elementary abelian by cyclic, \( G \) is an SBP (Sylow best possible) group and matches the description of Theorem 2.2 [5].
PROOF. Evidently every Sylow p-subgroup of G is a maximal subgroup and therefore G is solvable [6]. If N is a minimal normal subgroup of G then G = NQ, \(|N|, |Q| = 1\). This however implies G = N\langle x \rangle, |x| = q for some prime q.

The motivation for the next theorem is derived from the fact that Sylow subgroups corresponding to same prime in a subgroup H of a group G are conjugate in H itself. It characterizes groups in which not only Sylow subgroups but prime power subgroups of same order are conjugate in each subgroup.

**THEOREM 3.** If subgroups of same prime power order are conjugate in any subgroup of G then G is supersolvable, the Sylow p-subgroups for p > 2 are cyclic and the Sylow 2-subgroup has a cyclic normal subgroup of index 2.

**PROOF.** By induction every maximal subgroup of G is supersolvable and so G is solvable. Let N be a minimal normal subgroup of G. G/N is supersolvable by induction and since N is elementary abelian it follows that |N| = p, a prime. Therefore G is supersolvable.

Now suppose X is a minimal normal subgroup of G and let \(|X| = p\). Note that G has exactly one subgroup of order p. If P is a Sylow p-subgroup of G then every maximal subgroup of P has exactly one subgroup of order p and by induction is cyclic. Therefore all abelian normal subgroups of P are cyclic. By Theorem 7.6 [2, p. 304] P is cyclic if p > 2. If p = 2 then P has a cyclic normal subgroup of index 2.

Consider G/X and by induction all its Sylow p-subgroups for p > 2 are cyclic and a Sylow 2-subgroup has a cyclic maximal subgroup of index 2. This however implies that the Sylow subgroups of G have the desired property and the theorem is proved completely.

**THEOREM 4.** If every minimal subgroup of a group G is complemented in G then G is supersolvable.

**PROOF.** Let H be any subgroup of G and \(<a>\) be a minimal subgroup in H. Then G = \(<a>T, <a> \cap T = <e>\). Consequently, H = \(<a> (H \cap T), <a> \cap (H \cap T) = <e>\). By induction it now follows that every maximal subgroup of G is supersolvable and therefore G is solvable [5, Theorem 2.3, pp. 10]. Let N be a minimal normal subgroup of G. If b \in N then G = \(<b>K, <b> \cap K = <e>\) and K is a maximal subgroup of G. This implies N = \(<b> (N \cap K)\) by Dedekind's modular law and N being minimal normal in G it follows that N \cap K = \(<e>\). Hence N = \(<b>\) and G/N are supersolvable which however imply that G is supersolvable.

**REMARK.** The Sylow subgroups of such a group G as stated in the theorem are not necessarily cyclic as the instance of S_3 might suggest.

Let G = \(<a,b,x|a^3 = b^3 = 1, ab = ba, a^x = a^2, b^x = b^2, x^2 = e>\). G is a group of order 18 which is supersolvable and every minimal subgroup is complemented in G. However, the Sylow 3-subgroup of G is not cyclic.

Special Issue on
Intelligent Computational Methods for
Financial Engineering

Call for Papers

As a multidisciplinary field, financial engineering is becoming increasingly important in today’s economic and financial world, especially in areas such as portfolio management, asset valuation and prediction, fraud detection, and credit risk management. For example, in a credit risk context, the recently approved Basel II guidelines advise financial institutions to build comprehensible credit risk models in order to optimize their capital allocation policy. Computational methods are being intensively studied and applied to improve the quality of the financial decisions that need to be made. Until now, computational methods and models are central to the analysis of economic and financial decisions.

However, more and more researchers have found that the financial environment is not ruled by mathematical distributions or statistical models. In such situations, some attempts have also been made to develop financial engineering models using intelligent computing approaches. For example, an artificial neural network (ANN) is a nonparametric estimation technique which does not make any distributional assumptions regarding the underlying asset. Instead, ANN approach develops a model using sets of unknown parameters and lets the optimization routine seek the best fitting parameters to obtain the desired results. The main aim of this special issue is not to merely illustrate the superior performance of a new intelligent computational method, but also to demonstrate how it can be used effectively in a financial engineering environment to improve and facilitate financial decision making. In this sense, the submissions should especially address how the results of estimated computational models (e.g., ANN, support vector machines, evolutionary algorithm, and fuzzy models) can be used to develop intelligent, easy-to-use, and/or comprehensible computational systems (e.g., decision support systems, agent-based system, and web-based systems).

This special issue will include (but not be limited to) the following topics:

- **Computational methods**: artificial intelligence, neural networks, evolutionary algorithms, fuzzy inference, hybrid learning, ensemble learning, cooperative learning, multiagent learning
- **Application fields**: asset valuation and prediction, asset allocation and portfolio selection, bankruptcy prediction, fraud detection, credit risk management
- **Implementation aspects**: decision support systems, expert systems, information systems, intelligent agents, web service, monitoring, deployment, implementation

Authors should follow the Journal of Applied Mathematics and Decision Sciences manuscript format described at the journal site http://www.hindawi.com/journals/jamds/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/, according to the following timetable:
