SOME EXISTENCE AND UNIQUENESS RESULTS FOR FIRST-ORDER BOUNDARY VALUE PROBLEMS FOR IMPULSIVE FUNCTIONAL DIFFERENTIAL EQUATIONS WITH INFINITE DELAY IN FRÉCHET SPACES

JOHN R. GRAEF AND ABDELGHANI OUAHAB

Received 31 January 2006; Revised 19 May 2006; Accepted 28 May 2006

A recent nonlinear alternative for contraction maps in Fréchet spaces due to Frigon and Granas is used to investigate the existence and uniqueness of solutions to first-order boundary value problems for impulsive functional differential equations with infinite delay. An example to illustrate the results is included.

1. Introduction

This paper is devoted to the study of the existence and uniqueness of solutions of first-order boundary value problems for impulsive functional and neutral impulsive functional differential equations with infinite delay. In particular, in Section 3, we will consider the class of first-order boundary value problem for functional differential equations with impulsive effects,

\[ y'(t) = f(t, y_t), \quad \text{a.e. } t \in J := [0, \infty), \quad t \neq t_k, \quad k = 1, 2, \ldots, \tag{1.1} \]

\[ y(t^+_k) - y(t^-_k) = I_k(y(t^-_k)), \quad t = t_k, \quad k = 1, 2, \ldots, \tag{1.2} \]

\[ Ay_0 - x_\infty = \phi(t), \quad t \in (-\infty, 0], \tag{1.3} \]

where \( f : J \times \mathcal{B} \to \mathbb{R}^n \) and \( I_k : \mathbb{R}^n \to \mathbb{R}^n, k = 1, 2, \ldots, \) are given functions, \( \lim_{t \to -\infty} y(t) = x_\infty, \) \( A \neq 1, \) and \( \phi \in \mathcal{B}, \) which is called the phase space, will be defined later. Section 4 is devoted to the impulsive neutral functional differential equation with boundary conditions,

\[ \frac{d}{dt} [y(t) - g(t, y_t)] = f(t, y_t), \quad t \in J, \quad t \neq t_k, \quad k = 1, 2, \ldots, \]

\[ y(t^+_k) - y(t^-_k) = I_k(y(t^-_k)), \quad t = t_k, \quad k = 1, 2, \ldots, \]

\[ Ay_0 - x_\infty = \phi(t), \quad t \in (-\infty, 0], \tag{1.4} \]

where \( f, I_k, A, x_\infty, \) and \( \mathcal{B} \) are as in the problem (1.1)–(1.3) and \( g : J \times \mathcal{B} \to \mathbb{R}^n \) is a given function.
2 Impulsive functional differential equations

The notion of the phase space $\mathcal{B}$ plays an important role in the study of both the qualitative and quantitative theory of functional differential equations. A usual choice is a seminormed space satisfying suitable axioms as was introduced by Hale and Kato [18] (also see Kappel and Schappacher [21] and Schumacher [28]). For a detailed discussion on this topic, we refer the reader to Hino et al. [20]. For the case where the impulses are absent (i.e., $I_k = 0$, $k = 1, 2, \ldots$), an extensive theory has been developed for the problem (1.1), (1.3), and we refer the reader to Corduneanu and Lakshmikantham [8], Hale and Kato [18], Hino et al. [20], Lakshmikantham et al. [23], and Shin [29].

Impulsive differential equations have become increasingly important in recent years as mathematical models of real-world processes and phenomena studied in control theory, physics, chemistry, population dynamics, biotechnology, and economics. There has been a significant development in impulse theory and this has been especially true in the area of impulsive differential equations with fixed moments; see, for example, the monographs of Bainov and Simeonov [3], Lakshmikantham et al. [22], and Samoilenko and Perestyuk [27], as well as the papers of Agur et al. [2], Ballinger and Liu [4], Benchohra et al. [5, 6], Franco et al. [9], and the references contained therein.

Boundary value problems on infinite intervals appear in many problems of practical interest, for example, in linear elasticity, nonlinear fluid flow, and foundation engineering (e.g., see, [1, 13, 16, 24–26]). Recently, fixed point arguments using such approaches as the Banach contraction principle, fixed point index theory, and monotone iterative technique have been applied to first- and second-order impulsive differential equations. We mention here the survey papers by Guo [12, 14, 15], Guo and Liu [17], Yan and Liu [30], and the references therein. Very recently, a nonlinear alternative due to Frigon and Granas [10] was applied to impulsive functional differential equation with variable times [11]; see the paper by Benchohra et al. [7] for first-order equations and Henderson and Ouahab [19] for second- and higher-order problems. Our goal here is to give existence and uniqueness results for the problems (1.1)–(1.3) and (1.4) above by using this nonlinear alternative for contraction maps.

2 Preliminaries

In this short section, we introduce notations and definitions that are used throughout the remainder of this paper. We let $C([0, b], \mathbb{R}^n)$ denote the Banach space of all continuous functions from $[0, b]$ into $\mathbb{R}^n$ with the norm

$$\|y\|_{\infty} = \sup \{ \|y(t)\| : 0 \leq t \leq b \}, \quad (2.1)$$

and we let $L^1([0, \infty), \mathbb{R}^n)$ be the Banach space of measurable functions $y : [0, \infty) \to \mathbb{R}^n$ that are Lebesgue integrable with the norm

$$\|y\|_{L^1} = \int_0^{\infty} \|y(t)\| dt \quad \forall y \in L^1([0, \infty), \mathbb{R}^n). \quad (2.2)$$

For more details on the following notions, we refer the reader to Frigon and Granas [10]. Let $X$ be a Fréchet space with a family of seminorms $\{\| \cdot \|_n, n \in \mathbb{N}\}$. If $Y \subset X$, we say
that $Y$ is bounded if for every $n \in \mathbb{N}$ there exists $M_n > 0$ such that
\[ \|y\|_n \leq M_n \quad \forall y \in Y. \] (2.3)

We associate to $X$ a sequence of Banach spaces $\{(X^n, \| \cdot \|_n)\}$ as follows: for every $n \in \mathbb{N}$, we consider the equivalence relation $\sim_n$ defined by $x \sim_n y$ if and only if $\|x - y\|_n = 0$ for all $x, y \in X$. We let $X^n = (X/\sim_n, \| \cdot \|_n)$ denote the quotient space that is the completion of $X^n$ with respect to $\| \cdot \|_n$. To every $Y \subset X$, we associate a sequence $\{Y^n\}$ of subsets $Y^n \subset X^n$ as follows: for every $x \in X$, let $\{x\}_n$ denote the equivalence class of $x$ of subsets $X^n$, and we define $Y^n = \{\{x\}_n : x \in Y\}$. We let $\overline{Y}^n$, $\text{int}_n(Y^n)$, and $\partial_n Y^n$, respectively, denote the closure, the interior, and the boundary of $Y^n$ with respect to $\| \cdot \|_n$ in $X^n$. We will assume that the family of seminorms $\{\| \cdot \|_n\}$ satisfies
\[ \|x\|_1 \leq \|x\|_2 \leq \|x\|_3 \leq \cdots \quad \text{for every } x \in X. \] (2.4)

Next, we define what we mean by a contraction.

**Definition 2.1.** A function $f : X \to X$ is said to be a contraction if for each $n \in \mathbb{N}$ there exists $k_n \in (0, 1)$ such that
\[ \|f(x) - f(y)\|_n \leq k_n \|x - y\|_n \quad \forall x, y \in X. \] (2.5)

The following nonlinear alternative will be used to prove our main results.

**Theorem 2.2** (nonlinear alternative [10]). Let $X$ be a Fréchet space, let $Y \subset X$ be a closed subset in $X$, and let $N : Y \to X$ be a contraction such that $N(Y)$ is bounded. Then one of the following statements holds:

(C1) $N$ has a unique fixed point;
(C2) there exists $\lambda \in [0, 1)$, $n \in \mathbb{N}$, and $x \in \partial_n Y^n$ such that $\|x - \lambda N(x)\|_n = 0$.

We will also need the following definition.

**Definition 2.3.** The map $f : [0, \infty) \times \mathcal{B} \to \mathbb{R}^n$ is said to be $L^1$-Carathéodory if
(i) $t \mapsto f(t, x)$ is measurable for each $x \in \mathcal{B}$;
(ii) $x \mapsto f(t, x)$ is continuous for almost all $t \in [0, \infty)$;
(iii) for each $q > 0$ there exists $h_q \in L^1([0, \infty), \mathbb{R}_+)$ such that
\[ \|f(t, x)\| \leq h_q(t) \quad \forall \|x\|_{\mathcal{B}} \leq q \quad \text{and for almost all } t \in [0, \infty). \] (2.6)

3. **Functional differential equations**

In order to define the phase space and a solution of the problem (1.1)–(1.3), we consider the space
\[ \mathcal{P} = \{ y : (-\infty, \infty) \to \mathbb{R}^n \mid y(t^-_k) \text{ and } y(t^+_k) \text{ exist with } y(t_k) = y(t^-_k), \ A y(t) = \phi(t) \text{ for } t \leq 0, \ y_k \in C(J_k, \mathbb{R}^n), \ k = 1, 2, \ldots \}, \] (3.1)

where $y_k$ is the restriction of $y$ to $J_k = (t_k, t_{k+1}]$, $k = 1, 2, \ldots$. In the remainder of this paper, we will assume that $\mathcal{B}$ satisfies the following properties.
4 Impulsive functional differential equations

(A-1) If \( y : (-\infty, \infty) \rightarrow \mathbb{R}^n \) and \( y_0 \in \mathcal{B} \), then for every \( t \) in \([0, \infty)\), we have

(i) \( y_t \) is in \( \mathcal{B} \),

(ii) \( \| y_t \|_{\mathcal{B}} \leq K(t) \sup \{ |y(s)| : 0 \leq s \leq t \} + M(t) \| y_0 \|_{\mathcal{B}}, \) and

(iii) \( |y(t)| \leq H \| y_t \|_{\mathcal{B}}, \)

where \( H \geq 0 \) is a constant, \( K : [0, \infty) \rightarrow [0, \infty) \) is continuous, \( M : [0, \infty) \rightarrow [0, \infty) \) is locally bounded, and \( H, K, \) and \( M \) are independent of \( y \).

(A-2) For the function \( y \) in (A-1), \( y_t \) is a continuous function on \([0, \infty) \setminus \{ t_1, t_2, \ldots \} \).

(A-3) The space \( \mathcal{B} \) is complete.

Now set

\[
B^* = \{ y : (-\infty, \infty) \rightarrow \mathbb{R}^n : y \in \text{PC} \cap \mathcal{B} \},
\]

\[
B_k = \{ y \in B^* : \sup_{t \in I^*_k} |y(t)| < \infty \}, \quad \text{where } I^*_k = (-\infty, t_k].
\]

(3.2)

Let \( \| \cdot \|_k \) be the seminorm in \( B_k \) defined by

\[
\| y \|_k = \| y_0 \|_{\mathcal{B}} + \sup \{ |y(s)| : 0 \leq s \leq t_k \}, \quad y \in B_k.
\]

(3.3)

We will next define what we mean by a solution of (1.1)–(1.3).

Definition 3.1. A function \( y \) is said to be a solution of the problem (1.1)–(1.3) if \( y \) is in \( B^* \) and \( y \) satisfies (1.1)–(1.3).

To prove our existence results for the problem (1.1)–(1.3), we first establish the following lemma.

Lemma 3.2. Let \( f : [0, \infty) \rightarrow \mathbb{R}^n \) be a continuous function with \( \int_0^\infty f(s)ds < \infty \). Then \( y \) is a solution of the impulsive integral equation

\[
y(t) = \begin{cases} 
\phi(0) \frac{A}{A-1} + \frac{1}{A-1} \left[ \int_0^\infty f(y_s)ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \phi(t) \frac{A}{A}, & t \in (-\infty, 0], \\
\phi(0) \frac{A}{A-1} + \frac{1}{A-1} \left[ \int_0^t f(y_s)ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \int_0^t f(y_s)ds \\
+ \sum_{0<t_k<t} I_k(y(t_k^-)), & t \in [0, \infty),
\end{cases}
\]

(3.4)

if and only if \( y \) is a solution of the impulsive boundary value problem

\[
y'(t) = f(y_t), \quad t \in [0, \infty), \ t \neq t_k, \ k = 1, 2, \ldots,
\]

\[
y(t_k^-) - y(t_k^+) = I_k(y(t_k^-)), \quad k = 1, 2, \ldots,
\]

\[
Ay_0 - y_\infty = \phi(t), \quad t \in (-\infty, 0],
\]

(3.5)

(3.6)

(3.7)

where \( \lim_{t \to -\infty} y(t) = y_\infty \).
Proof. Let $y$ be a solution of the impulsive integral equation (3.4). Then for $t \in [0, \infty)$ and $t \neq t_k, k = 1, 2, \ldots$, we have

$$y(t) = \phi(0) + \frac{1}{A - 1} \left[ \int_0^t f(y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \int_0^t f(y_s) ds + \sum_{0<t_k<t} I_k(y(t_k^-)).$$

(3.8)

Thus, $y'(t) = f(y_t)$ for $t \in [0, \infty)$ and $t \neq t_k, k = 1, 2, \ldots$. From the definition of $y$, we see that

$$y(t_k^+) - y(t_k^-) = I_k(y(t_k^-)) \quad \text{for } k = 1, 2, \ldots.$$  

(3.9)

Finally, to see that $Ay_0 - y_\infty = \phi(t)$ for $t \in (-\infty, 0]$, note that

$$y_\infty = \phi(0) + \frac{A}{A - 1} \left[ \int_0^{\infty} f(y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right],$$

$$y_0 = \phi(0) + \frac{1}{A - 1} \left[ \int_0^{\infty} f(y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \phi(t).$$

(3.10)

Hence,

$$Ay_0 - y_\infty = \phi(0) + \frac{A}{A - 1} \left[ \int_0^{\infty} f(y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \phi(t) - \phi(0)$$

$$- \frac{A}{A - 1} \left[ \int_0^{\infty} f(y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] = \phi(t).$$

(3.11)

Now let $y$ be a solution of the problem (3.5)–(3.7). Then,

$$y'(t) = f(y_t) \quad \text{for } t \in [0, t_1],$$

(3.12)

and an integration from 0 to $t \in (0, t_1]$ yields

$$y(t) - y(0) = \int_0^t y'(s) ds = \int_0^t f(y_s) ds$$

(3.13)

or

$$y(t) = y(0) + \int_0^t f(y_s) ds$$

(3.14)

for $t \in [0, t_1]$. If $t \in (t_1, t_2]$, then

$$y(t_1^-) - y(0) + y(t) - y(t_1^+) = \int_0^{t_1} y'(s) ds + \int_{t_1}^t y'(s) ds = \int_0^t f(y_s) ds,$$

(3.15)
6 Impulsive functional differential equations

so

\[ y(t) = y(0) + \int_0^t f(y_s) \, ds + I_1(y(t_1)). \]  \hspace{1cm} (3.16)

Continuing this procedure, we obtain

\[ y(t) = y(0) + \int_0^t f(y_s) \, ds + \sum_{0 < t_k < t} I_k(y(t_k)) \]  \hspace{1cm} (3.17)

for \( t \in [0, \infty) \). Since \( \lim_{t \to \infty} y(t) = y_\infty \), we have

\[ y_\infty = y(0) + \int_0^{\infty} f(y_s) \, ds + \sum_{k=1}^{\infty} I_k(y(t_k)). \]  \hspace{1cm} (3.18)

From (3.7), we have \( y_\infty = Ay(0) - \phi(0) \), and so

\[ y(0) = \frac{\phi(0)}{A - 1} + \frac{1}{A - 1} \left[ \int_0^{\infty} f(y_s) \, ds + \sum_{k=1}^{\infty} I_k(y(t_k)) \right]. \]  \hspace{1cm} (3.19)

Substituting (3.19) into (3.17), we obtain

\[ y(t) = \frac{\phi(0)}{A - 1} + \frac{1}{A - 1} \left[ \int_0^{\infty} f(y_s) \, ds + \sum_{k=1}^{\infty} I_k(y(t_k)) \right] + \int_0^t f(y_s) \, ds + \sum_{0 < t_k < t} I_k(y(t_k)) \]  \hspace{1cm} (3.20)

for \( t \in [0, \infty) \).

From (3.7), (3.18), and (3.19), we have

\[ y(t) = \frac{\phi(t)}{A} + \frac{1}{A} \left[ y(0) + \int_0^{\infty} f(y_s) \, ds + \sum_{k=1}^{\infty} I_k(y(t_k)) \right] \]

\[ = \frac{\phi(0)}{A(A - 1)} + \frac{1}{A - 1} \left[ \int_0^{\infty} f(y_s) \, ds + \sum_{k=1}^{\infty} I_k(y(t_k)) \right] + \frac{\phi(t)}{A} \]  \hspace{1cm} (3.21)

for \( t \in (-\infty, 0] \). This completes the proof of the lemma.

We are now ready to prove our existence and uniqueness result for the problem (1.1)–(1.3).

**Theorem 3.3.** Let \( f : J \times \mathbb{R} \to \mathbb{R}^n \) be an \( L^1 \)-Carathéodory function and assume that

(H1) there exist constants \( d_k > 0, k = 1, 2, \ldots \), such that

\[ \|I_k(x) - I_k(\bar{x})\| \leq d_k \|x - \bar{x}\| \quad \text{for each } k = 1, 2, \ldots, \forall x, \bar{x} \in \mathbb{R}^n; \]  \hspace{1cm} (3.22)

(H2) there exists a function \( l \in L^1([0, \infty), \mathbb{R}^n) \) such that

\[ \|f(t,x) - f(t,\bar{x})\| \leq l(t)\|x - \bar{x}\|_{\mathcal{B}} \quad \text{for each } t \in [0, \infty), \forall x, \bar{x} \in \mathcal{B}; \]  \hspace{1cm} (3.23)
(H3) there exist a function $p \in L^1([0, \infty), \mathbb{R}_+)$ and positive constants $c_k$, $k = 1, 2, \ldots$, such that
\[
\| f(t, u) \| \leq p(t) \quad \text{for } (t, u) \in [0, \infty) \times \mathcal{B},
\]
\[
\| I_k(z) \| \leq c_k \quad \forall z \in \mathbb{R}^n,
\]
\[
\sum_{k=1}^{\infty} c_k < \infty.
\]
(3.24)

If $\sum_{k=1}^{\infty} d_k < 1$, then the problem (1.1)–(1.3) has a unique solution.

Proof. We transform the problem (1.1)–(1.3) into a fixed point problem. Consider the operator $N : B_* \to B_*$ defined by
\[
N(y)(t) = \begin{cases} 
\frac{\phi(0)}{A(A-1)} + \frac{1}{A-1} \left[ \int_0^\infty f(s, y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \frac{\phi(t)}{A}, & t \in (-\infty, 0], \\
\frac{\phi(0)}{A(A-1)} + \frac{1}{A-1} \left[ \int_0^\infty f(s, y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \int_0^t f(s, y_s) ds + \sum_{0 < t_k < t} I_k(y(t_k^-)), & t \in [0, \infty).
\end{cases}
\]
(3.25)

It should be clear from Lemma 3.2 that the fixed points of $N$ are solutions of the problem (1.1)–(1.3). Let $x : (-\infty, \infty) \to \mathbb{R}^n$ be the function defined by
\[
x(t) = \begin{cases} 
\frac{\phi(0)}{A-1} + \frac{1}{A-1} \left[ \int_0^\infty f(s, x_s) ds + \sum_{k=1}^{\infty} I_k(x(t_k^-)) \right] & \text{if } t \in [0, \infty), \\
\frac{\phi(0)}{A(A-1)} + \frac{1}{A-1} \left[ \int_0^\infty f(s, x_s) ds + \sum_{k=1}^{\infty} I_k(x(t_k^-)) \right] + \frac{\phi(t)}{A} & \text{if } t \in (-\infty, 0].
\end{cases}
\]
(3.26)

Then,
\[
x_0 = \frac{\phi(0)}{A-1} + \frac{1}{A-1} \left[ \int_0^\infty f(s, x_s) ds + \sum_{k=1}^{\infty} I_k(x(t_k^-)) \right].
\]
(3.27)

For each $z \in C([0, \infty), \mathbb{R}^n)$ with $z(0) = 0$, denote by $\tilde{z}$ the function given by
\[
\tilde{z}(t) = \begin{cases} 
z(t) & \text{if } t \in [0, \infty), \\
0 & \text{if } t \in (-\infty, 0].
\end{cases}
\]
(3.28)

If $y$ satisfies the integral equation
\[
y(t) = \frac{\phi(0)}{A-1} + \frac{1}{A-1} \left[ \int_0^\infty f(s, y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \int_0^t f(s, y_s) ds + \sum_{0 < t_k < t} I_k(y(t_k^-)),
\]
(3.29)
we can decompose $y$ into $y(t) = \bar{z}(t) + x(t)$, $0 \leq t < \infty$, which implies that $y_t = \bar{z}_t + x_t$ for $0 \leq t < \infty$, and $z$ satisfies

$$z(t) = \int_0^t f(s, \bar{z}_s + x_s) \, ds + \sum_{0 < t_k < t} I_k(\bar{z}(t_k^-) + x(t_k^-)).$$

(3.30)

Let

$$B^k_* = \{z \in B_k : z_0 = 0\}.$$  

(3.31)

For any $z \in B^k_*$, we have

$$\|z\|_k = \|z_0\|_{\bar{B}} + \sup \{\|z(s)\| : 0 \leq s \leq t_k\} = \sup \{\|z(s)\| : 0 \leq s \leq t_k\}.$$  

(3.32)

Thus $(B^k_*, \| \cdot \|_k)$ is a Banach space. If we set

$$C_0 = \{z \in B_* : z_0 = 0\}$$

(3.33)

with the Bielecki-type norm on $B^k_*$ defined by

$$\|z\|_{B^k_*} = \max \left\{\|z(t)\| e^{-\tilde{l}(t)} : t \in [0, t_k]\right\},$$

(3.34)

where $\tilde{l}(t) = \int_0^t \tilde{l}(s) \, ds$, $\tilde{l}(t) = K_k l(t)$, $K_k = \sup \{|K(t)| : t \in [0, t_k]\}$, $k = 1, 2, \ldots$, and $\tau > 0$ is a constant, then $C_0$ is a Fréchet space with the family of seminorms $\| \cdot \|_{B^k_*}$.

Let the operator $P : C_0 \to C_0$ be defined by

$$(Pz)(t) = \begin{cases} 0, & t \leq 0, \\ \int_0^t f(s, \bar{z}_s + x_s) \, ds + \sum_{0 < t_k < t} I_k(\bar{z}(t_k^-) + x(t_k^-)), & t \in [0, \infty). \end{cases}$$

(3.35)

Clearly, the operator $N$ having a fixed point is equivalent to the operator $P$ having one, and so we turn our attention to proving that $P$ does have a fixed point. We will use the nonlinear alternative given in Theorem 2.2 to show this.

Let $z$ be a possible solution of the problem $z = \lambda P(z)$ for some $0 < \lambda < 1$. Then, for each $t \in [0, \infty)$,

$$z(t) = \lambda \left[ \int_0^t f(s, \bar{z}_s + x_s) \, ds + \sum_{0 < t_k < t} I_k(\bar{z}(t_k^-) + x(t_k^-)) \right].$$

(3.36)

so by (H3), we have

$$\|z(t)\| < \int_0^t |p(s)| \, ds + \sum_{i=1}^{i=k} I_i(\bar{z}(t_i^-) + x(t_i^-)) | \leq \int_0^{t_k} |p(s)| \, ds + \sum_{i=1}^{i=k} c_i := M^*_k.$$  

(3.37)

Hence,

$$\sup \{\|z(t)\| : t \in [0, t_k]\} < M^*_k.$$  

(3.38)
Let
\[ Y = \left\{ z \in C_0 \mid \sup \left\{ \| z \|_{B_k^+} : 0 \leq t \leq t_k \right\} \leq M_k^* \quad \forall k = 1,2,\ldots \right\}. \]  
(3.39)

Clearly, \( Y \) is a closed subset of \( C_0 \). We will show that \( P : Y \to B_k^+ \) is a contraction map. To see this, consider \( z, z^* \in Y \); then for each \( t \in [0,t_k] \) and \( k = 1,2,\ldots \), we have
\[
\| P(z)(t) - P(z^*)(t) \| \leq \int_0^t \| f(s, \tilde{z}_s + x_s) - f(s, \tilde{z}_s^* + x_s) \| ds \\
+ \sum_{i=1}^{i=k} \| I_i(\tilde{z}(t_i^-) + x(t_i^-)) - I_i(\tilde{z}^*(t_i^-) + x(t_i^-)) \| \\
\leq \int_0^t l(s) \| \tilde{z}_s - \tilde{z}_s^* \| ds + \sum_{i=1}^{i=k} d_i \| z(t_i^-) - z^*(t_i^-) \| \\
\leq \int_0^t \tilde{l}(s) e^{\tilde{r}(s)} e^{-\tilde{r}(t)} \sup_{s \in [0,t]} \| z(s) - z^*(s) \| ds \\
+ \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} e^{-\tilde{r}(t)} \sup_{s \in [0,t]} \| z(s) - z^*(s) \| \\
= \int_0^t \tilde{l}(s) e^{\tilde{r}(s)} ds \| z - z^* \|_{B_k^+} + \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} \| z - z^* \|_{B_k^+} \\
= \frac{1}{\tau} \int_0^t (e^{\tilde{r}(t)})' ds \| z - z^* \|_{B_k^+} + \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} \| z - z^* \|_{B_k^+} \\
\leq \frac{1}{\tau} e^{\tilde{r}(t)} ds \| z - z^* \|_{B_k^+} + \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} \| z - z^* \|_{B_k^+}. 
\]  
(3.40)

Thus,
\[
e^{-\tilde{r}(t)} \| P(z)(t) - P(z^*)(t) \| \leq \frac{1}{\tau} \| z - z^* \|_{B_k^+} + \sum_{i=1}^{i=k} d_i \| z - z^* \|_{B_k^+} = \left( \frac{1}{\tau} + \sum_{i=1}^{i=k} d_i \right) \| z - z^* \|_{B_k^+}. 
\]  
(3.41)

Therefore,
\[
\| P(z) - P(z^*) \|_{B_k^+} \leq \left( \frac{1}{\tau} + \sum_{i=1}^{i=k} d_i \right) \| z - z^* \|_{B_k^+}, 
\]  
(3.42)

which shows that if \( \tau \) is large enough, then \( P \) is a contraction. From the choice of \( Y \), there is no \( z \in \partial Y^n \) such that \( z = \lambda P(z) \) for some \( \lambda \in (0,1) \). As a consequence of Theorem 2.2,
we conclude that \( P \) has a unique fixed point. In turn, this implies that the operator \( N \) has a unique fixed point that is a solution to (1.1)–(1.3). This completes the proof of the theorem. \( \square \)

4. Neutral functional differential equations

This section is concerned with the existence of solutions to the boundary value problem for first-order neutral functional differential equations with infinite delay and impulses given in (1.4). Our main result is as follows.

**Theorem 4.1.** Let \( f : I \times \mathcal{B} \to \mathbb{R}^n \) be an \( L^1 \)-Carathéodory function. In addition to (H1)–(H3), assume that \( M(0) < 1 \) and

(B) there exist constants \( c_{1}^*, c_{2}^* \geq 0 \), and \( \tilde{d}_k > 0 \), \( k = 1, 2, \ldots \), such that

\[
\| g(t, u) \| \leq c_{1}^* \| u \|_{\mathcal{B}} + c_{2}^*, \quad t \in [0, \infty), \quad u \in \mathcal{B}, \quad c_{1}^* K_k < 1,
\]

\[
\| g(t, u) - g(t, \bar{u}) \| \leq \tilde{d}_k \| u - \bar{u} \|_{\mathcal{B}} \quad \text{for } t \in [0, t_k],
\]

where

\[
K_k = \sup \{ \| K(t) \| : t \in [0, t_k], \quad k = 1, 2, \ldots \}
\]

If \( \sum_{k=1}^{\infty} [d_k + \tilde{d}_k K_k] < 1 \), then the problem (1.4) has a unique solution.

**Proof.** We proceed similarly to what we did in the proof of Theorem 3.3 by defining the operators \( N_1 : \mathcal{B}_* \to \mathcal{B}_* \) and \( P_1 : C_0 \to C_0 \) by

\[
N_1(y)(t) = \begin{cases} 
  g(0, \phi(0)) - g(t, \phi(t)) + \frac{\phi(0)}{A(A - 1)} + \frac{\phi(t)}{A} + \frac{1}{A - 1} \left[ \int_{0}^{\infty} f(s, y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right], & t \in (-\infty, 0], \\
  g(0, \phi) - g(t, y_t) + \frac{1}{A - 1} \left[ \int_{0}^{\infty} f(s, y_s) ds + \sum_{k=1}^{\infty} I_k(y(t_k^-)) \right] + \frac{\phi(0)}{A - 1} + \int_{0}^{t} f(s, y_s) ds + \sum_{0 < t_k < t} I_k(y(t_k^-)), & t \in [0, \infty),
\end{cases}
\]

\[
(P_1 z)(t) = \begin{cases} 
  0, & t \leq 0, \\
  g(0, \phi) - g(t, \bar{z}_t + x_t) + \int_{0}^{t} f(s, \bar{z}_s + x_s) ds + \sum_{0 < t_k < t} I_k(\bar{z}(t_k^-) + x(t_k^-)), & t \in [0, \infty),
\end{cases}
\]

where \( \bar{z}_t \) and \( x_t \) are defined similar to the way they are in the proof of Theorem 3.3. In order to apply the nonlinear alternative, Theorem 2.2, we first obtain a priori estimates for the solutions of the integral equation

\[
z(t) = \lambda \left[ g(0, \phi) - g(t, \bar{z}_t + x_t) + \int_{0}^{t} f(s, \bar{z}_s + x_s) ds + \sum_{0 < t_k < t} I_k(\bar{z}(t_k^-) + x(t_k^-)) \right]
\]

(4.4)
for any $\lambda \in (0, 1)$. We have

$$
\|z(t)\| < \|g(0, \phi(0))\| + \|g(t, \bar{z}_t + \bar{x}_t)\| + \int_0^t p(s) ds + \sum_{0 < t_k < t} \|I_k(\bar{z}(t_k^-) + \bar{x}(t_k^-))\|
\leq \|g(0, \phi)\| + c_1^* \|\bar{z}_t + \bar{x}_t\| + c_2^* \int_0^t p(s) ds + \sum_i c_i
\leq \|g(0, \phi(0))\| + c_1^* K(t) \sup_{s \in [0, t]} |z(s)| + c_1^* K(t) \sup_{s \in [0, t]} |x(s)| + c_1^* M(t) \|x_0\|_{\mathcal{B}}
+ c_1^* \int_0^t p(s) ds + \sum_{i=1}^k c_i
\leq \|g(0, \phi(0))\| + c_1^* K(t) \sup_{s \in [0, t]} |z(s)| + c_1^* M(t) \|x_0\|_{\mathcal{B}}
+ c_1^* \int_0^t p(s) ds + \sum_{i=1}^k c_i,
$$

(4.5)

where

$$
M_k = \sup \{M(t) : t \in [0, t_k]\}.
$$

(4.6)

Hence,

$$
\|z\|_{\infty} < \|g(0, \phi)\| + c_1^* K(t) \|\bar{z}\|_{\infty} + K_k c_1^* \|x\|_{\infty} + M_k c_1^* \|x_0\|_{\mathcal{B}} + c_1^* \int_0^t p(s) ds + \sum_{i=1}^k c_i,
$$

(4.7)

Now,

$$
\|x_0\|_{\mathcal{B}} \leq K(0) \|x(0)\| + M(0) \|x_0\|_{\mathcal{B}},
$$

(4.8)

so

$$
\|x_0\|_{\mathcal{B}} \leq \frac{K(0)}{1 - M(0)} \|x(0)\|,
$$

(4.9)

and since

$$
\|x\|_{\infty} := \sup_{t \in [0, t_k]} |x(t)| \leq \frac{|\phi(0)|}{A - 1} + \frac{1}{A - 1} \left[\|p\|_{L^1} + \sum_{k=1}^{\infty} c_k\right] := \ell,
$$

(4.10)

we then have

$$
\|z\|_{\infty} < \frac{1}{1 - c_1^* K_k} \left[\|g(0, \phi)\| + c_2^* + K_k c_1^* \ell + M_k c_1^* \frac{K(0)}{1 - M(0)} \ell + \|p\|_{L^1} + \sum_{i=1}^k c_i\right] := \overline{M}_k.
$$

(4.11)
Now set

\[ Y_1 = \{ z \in C_0 : \sup \{ ||z(t)|| : 0 \leq t \leq t_k \} \leq \overline{M}_k \ \forall k = 1,2,... \} . \tag{4.12} \]

Clearly, \( Y_1 \) is a closed subset of \( C_0 \). To show that \( P_1 \) is a contraction, let \( z, z^* \in Y_1 \). Then, for each \( t \in [0,t_k] \) and \( k = 1,2,... \), we have

\[ ||P_1(z)(t) - P_1(z^*)(t)|| \]

\[ \leq \left[ g(t,z_t + x_t) - g(t,z_t^* + x_t) \right] + \int_0^t \left[ ||f(s,z_s + x_s) - f(s,z_s^* + x_s)|| \right] ds \]

\[ + \sum_{i=1}^{i=k} \left[ ||I_i(\dot{z}(t_i^-) + x(t_i^-)) - I_i(\dot{z}^*(t_i^-) + x(t_i^-))|| \right] \leq \bar{d}_k ||\dot{z}_t - z_t^*||_{\gamma_b} \]

\[ + \int_0^t l(s)||\dot{z}_s - z_s^*||_{\gamma_b} ds + \sum_{i=1}^{i=k} d_i ||z(t_i^-) - z^*(t_i^-)|| \leq \bar{d}_k K_k \sup_{t \in [0,t_k]} ||z(t) - z^*(t)|| \]

\[ + \int_0^t l(s)K_k \sup_{r \in [0,s]} ||z(r) - z^*(r)|| ds + \sum_{i=1}^{i=k} d_i ||z(t_i^-) - z^*(t_i^-)|| \]

\[ \leq \bar{d}_k K_k e^{\tilde{r}(t)} e^{-\bar{r}(t)} \sup_{t \in [0,t_k]} ||z(t) - z^*(t)|| + \int_0^t \widetilde{l}(s)e^{\tilde{r}(s)} e^{-\bar{r}(s)} \sup_{r \in [0,s]} ||z(r) - z^*(r)|| ds \]

\[ + \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} e^{-\bar{r}(t)} \sup_{s \in [0,t_k]} ||z(s) - z^*(s)|| \leq \bar{d}_k K_k e^{\tilde{r}(t)} ||z - z^*||_{B^*_b} \]

\[ + \int_0^t \tilde{l}(s)e^{\tilde{r}(s)} ds ||z - z^*||_{B^*_b} + \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} ||z - z^*||_{B^*_b} = \bar{d}_k K_k e^{\tilde{r}(t)} ||z - z^*||_{B^*_b} \]

\[ + \frac{1}{\tau} \int_0^t (e^{\tilde{r}(s)})\tau ds ||z - z^*||_{B^*_b} + \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} ||z - z^*||_{B^*_b} \leq \bar{d}_k K_k e^{\tilde{r}(t)} ||z - z^*||_{B^*_b} \]

\[ + \frac{1}{\tau} e^{\tilde{r}(t)} ds ||z - z^*||_{B^*_b} + \sum_{i=1}^{i=k} d_i e^{\tilde{r}(t)} ||z - z^*||_{B^*_b} \]

\[ \leq \bar{d}_k K_k e^{\tilde{r}(t)} ||z - z^*||_{B^*_b} \tag{4.13} \]

Thus,

\[ e^{-\bar{r}(t)} ||P_1(z)(t) - P_1(z^*)(t)|| \leq \left( \frac{1}{\tau} + \sum_{i=1}^{i=k} d_i + \bar{d}_k K_k \right) ||z - z^*||_{B^*_b} \tag{4.14} \]

Therefore,

\[ ||P_1(z) - P_1(z^*)||_{B^*_b} \leq \left( \frac{1}{\tau} + \sum_{i=1}^{i=k} d_i + \bar{d}_k K_k \right) ||z - z^*||_{B^*_b} , \tag{4.15} \]
and again if $\tau$ is large enough, $P_1$ is a contraction. From the choice of $Y_1$, there is no $z \in \partial Y_1^n$ such that $z = \lambda P_1(z)$ for some $\lambda \in (0,1)$. As a consequence of the nonlinear alternative (Theorem 2.2), we see that $P_1$ has a unique fixed point which again leads to the existence of a unique solution to (1.4). □

5. Example

In this section we give an example to illustrate the usefulness of our main results. Consider the problem

$$y'(t) = \frac{e^{-\gamma t} |y_t|}{(t+1)(t+2)(1 + |y_t|)}, \quad \text{a.e. } t \in J := [0, \infty) - \{t_1,t_2,\ldots\},$$

$$y(t^+_{k}) - y(t^-_{k}) = b_k y(t^-_{k}), \quad k = 1,2,\ldots,$$

$$y(t) = \phi(t), \quad t \in (-\infty,0],$$

(5.1)

where $\gamma > 0$ is a constant and $b_k > 0$ for $k = 1,2,\ldots$. Let

$$\mathcal{D} = \{\psi : (-\infty,0] \rightarrow \mathbb{R}^n \mid \psi \text{ is continuous everywhere except for a countable number of points } \bar{t} \text{ at which } \psi(\bar{t}^-), \psi(\bar{t}^+), \exists, \psi(\bar{t}^-) = \psi(\bar{t})\}.$$ 

(5.2)

Let

$$B_\gamma = \{y \in \mathcal{D} : \lim_{\theta \rightarrow -\infty} e^{\gamma \theta} y(\theta) \text{ exists in } \mathbb{R}^n\}$$

(5.3)

with the norm in $B_\gamma$ given by

$$\|y\|_\gamma = \sup_{-\infty < \theta \leq 0} e^{\gamma \theta} \|y(\theta)\|.$$ 

(5.4)

Let $y : (-\infty,\infty) \rightarrow \mathbb{R}^n$ be such that $y_0 \in B_\gamma$; then

$$\lim_{\theta \rightarrow -\infty} e^{\gamma \theta} y_t(\theta) = \lim_{\theta \rightarrow -\infty} e^{\gamma \theta} y(t + \theta) = \lim_{\theta \rightarrow -\infty} e^{\gamma(\theta-t)} y(\theta) = e^{-\gamma t} \lim_{\theta \rightarrow -\infty} e^{\gamma \theta} y_0(\theta) < \infty.$$ 

(5.5)

Hence, $y_t \in B_\gamma$.

Next, we prove that $|y(t)| \leq H \|y_t\|_{B_\gamma}$ and

$$\|y_t\| \leq K(t) \sup \{\|y(s)\| : 0 \leq s \leq t\} + M(t)\|y_0\|_{\gamma},$$

(5.6)

where $\|y_t(\theta)\|_\gamma = \|y(t + \theta)\|$, $K(t) \equiv M(t) \equiv 1$, and $H = 1$. Now, if $\theta + t \leq 0$, we have

$$\|y_t(\theta)\|_\gamma \leq \sup \{\|y(s)\| : -\infty < s \leq 0\}.$$ 

(5.7)

For $t + \theta \geq 0$, we see that

$$\|y_t(\theta)\|_\gamma \leq \sup \{\|y(s)\| : 0 < s \leq t\}. $$

(5.8)
Thus, for all $t + \theta \in \mathbb{R}$, we obtain
\[
\|y_t(\theta)\| \leq \sup \{\|y(s)\| : -\infty < s \leq 0\} + \sup \{\|y(s)\| : 0 \leq s \leq t\}. \tag{5.9}
\]
Then,
\[
\|y_t\|_{B_y} \leq \|y_0\|_{B_y} + \sup \{\|y(s)\| : 0 \leq s \leq t\}. \tag{5.10}
\]
Now $(B_y, \|\cdot\|)$ is a Banach space and $B_y$ will serve as the phase space for our problem.

We see that the function $f$ satisfies
\[
|f(t, x)| = \frac{e^{-\gamma t}|x|}{(t+1)(t+2)(1+|x|)} \leq \frac{1}{(t+1)(t+2)} = p(t),
\]
\[
\int_0^\infty p(t)dt = \int_0^\infty \frac{1}{(t+1)(t+2)}dt = \ln 2. \tag{5.11}
\]
Let $x, y \in B_Y$; then,
\[
|f(t, x) - f(t, y)| = \frac{e^{-\gamma t}|x|}{(t+1)(t+2)} \left|\frac{|x|}{1+|x|} - \frac{|y|}{1+|y|}\right| = \frac{e^{-\gamma t}|x| - |y|}{(t+1)(t+2)(1+|x|)(1+|y|)}
\]
\[
\leq \frac{e^{-\gamma t}|x - y|}{(t+1)(t+2)(1+|x|)(1+|y|)} \leq \frac{\|x - y\|_{B_y}}{(t+1)(t+2)}. \tag{5.12}
\]

Hence, the hypotheses of Theorem 3.3 are satisfied, so if $\sum_{k=1}^\infty b_k < 1$, then the problem (5.1) has a unique solution.

Special Issue on
Intelligent Computational Methods for Financial Engineering

Call for Papers

As a multidisciplinary field, financial engineering is becoming increasingly important in today's economic and financial world, especially in areas such as portfolio management, asset valuation and prediction, fraud detection, and credit risk management. For example, in a credit risk context, the recently approved Basel II guidelines advise financial institutions to build comprehensible credit risk models in order to optimize their capital allocation policy. Computational methods are being intensively studied and applied to improve the quality of the financial decisions that need to be made. Until now, computational methods and models are central to the analysis of economic and financial decisions.

However, more and more researchers have found that the financial environment is not ruled by mathematical distributions or statistical models. In such situations, some attempts have also been made to develop financial engineering models using intelligent computing approaches. For example, an artificial neural network (ANN) is a nonparametric estimation technique which does not make any distributional assumptions regarding the underlying asset. Instead, ANN approach develops a model using sets of unknown parameters and lets the optimization routine seek the best fitting parameters to obtain the desired results. The main aim of this special issue is not to merely illustrate the superior performance of a new intelligent computational method, but also to demonstrate how it can be used effectively in a financial engineering environment to improve and facilitate financial decision making. In this sense, the submissions should especially address how the results of estimated computational models (e.g., ANN, support vector machines, evolutionary algorithm, and fuzzy models) can be used to develop intelligent, easy-to-use, and/or comprehensible computational systems (e.g., decision support systems, agent-based system, and web-based systems).

This special issue will include (but not be limited to) the following topics:

- **Computational methods:** artificial intelligence, neural networks, evolutionary algorithms, fuzzy inference, hybrid learning, ensemble learning, cooperative learning, multiagent learning
- **Application fields:** asset valuation and prediction, asset allocation and portfolio selection, bankruptcy prediction, fraud detection, credit risk management
- **Implementation aspects:** decision support systems, expert systems, information systems, intelligent agents, web service, monitoring, deployment, implementation

Authors should follow the Journal of Applied Mathematics and Decision Sciences manuscript format described at the journal site http://www.hindawi.com/journals/jamds/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
