ANALOGUES OF SOME TAUBERIAN THEOREMS FOR STRETCHINGS

RICHARD F. PATTERSON

(Received 22 September 1999)

Abstract. We investigate the effect of four-dimensional matrix transformation on new classes of double sequences. Stretchings of a double sequence is defined, and this definition is used to present a four-dimensional analogue of D. Dawson’s copy theorem for stretching of a double sequence. In addition, the multidimensional analogue of D. Dawson’s copy theorem is used to characterize convergent double sequences using stretchings.

2000 Mathematics Subject Classification. 40B05, 40C05.

1. Introduction. In this paper, RH-regular matrices and the stretching of double sequences are used to characterize P-convergent sequences. To achieve this goal we begin by defining an ε-Pringsheim-copy and a stretching of double sequences. In addition, the copy theorem of Dawson in [1] will be extended as follows: if each of A and T is an RH-regular matrix, and x is any bounded double complex sequence with ε being any bounded positive term double sequence with \( P-\lim_{i,j} e_{i,j} = 0 \), then there exists a stretching y of x such that \( T(Ay) \) exists and contains an ε-Pringsheim-copy of x. By using this extended copy theorem some natural implications and variations of this extended copy theorem will be presented.

2. Definitions, notations, and preliminary results

Definition 2.1 (see [3]). A double sequence \( x = [x_{k,l}] \) has Pringsheim limit L (denoted by \( P-\lim x = L \)) provided that given \( \epsilon > 0 \) there exists \( N \in \mathbb{N} \) such that \( |x_{k,l} - L| < \epsilon \) whenever \( k, l > N \). We will describe such an x more briefly as “P-convergent.”

Definition 2.2 (see [3]). A double sequence x is called definite divergent, if for every (arbitrarily large) \( G > 0 \) there exist two natural numbers \( n_1 \) and \( n_2 \) such that \( |x_{n,k}| > G \) for \( n \geq n_1, k \geq n_2 \).

Definition 2.3. The double sequence \( [y] \) is a double subsequence of the sequence \( [x] \) provided that there exist two increasing double index sequences \( \{n_j\} \) and \( \{k_j\} \) such that if \( z_j = x_{n_j,k_j} \), then y is formed by

\[
\begin{array}{cccccc}
z_1 & z_2 & z_5 & z_{10} \\
z_4 & z_3 & z_6 & -\\
z_9 & z_8 & z_7 & -\\
- & - & - & -
\end{array}
\]
The double sequence \( x \) is bounded if and only if there exists a positive number \( M \) such that \( |x_{k,l}| < M \) for all \( k \) and \( l \). A two-dimensional matrix transformation is said to be regular if it maps every convergent sequence into a convergent sequence with the same limit. The Silverman-Toeplitz theorem [5, 6] characterizes the regularity of two-dimensional matrix transformations. In [4], Robison presented a four-dimensional analog of regularity for double sequences in which he added an additional assumption of boundedness. This assumption was made because a double sequence which is \( P \)-convergent is not necessarily bounded. The definition of regularity for four-dimensional matrices will be stated below along with the Robison-Hamilton characterization of the regularity of four-dimensional matrices.

**DEFINITION 2.4.** The four-dimensional matrix \( A \) is said to be RH-regular if it maps every bounded \( P \)-convergent sequence into a \( P \)-convergent sequence with the same \( P \)-limit.

**THEOREM 2.5** (see [2, 4]). The four-dimensional matrix \( A \) is RH-regular if and only if

1. \( \text{RH}_1 \) \( P \)-\( \lim \lim_{m,n} a_{m,n,k,l} = 0 \) for each \( k \) and \( l \);
2. \( \text{RH}_2 \) \( P \)-\( \lim \lim_{m,n} \sum_{k,l=1}^{\infty} a_{m,n,k,l} = 1 \);
3. \( \text{RH}_3 \) \( P \)-\( \lim \lim_{m,n} \sum_{k=1}^{\infty} |a_{m,n,k,l}| = 0 \) for each \( l \);
4. \( \text{RH}_4 \) \( P \)-\( \lim \lim_{m,n} \sum_{l=1}^{\infty} |a_{m,n,k,l}| = 0 \) for each \( k \);
5. \( \text{RH}_5 \) \( \sum_{k,l=1}^{\infty} |a_{m,n,k,l}| \) is \( P \)-convergent; and
6. \( \text{RH}_6 \) there exist finite positive integers \( A \) and \( B \) such that \( \sum_{k,l>B} |a_{m,n,k,l}| < A \).

**EXAMPLE 2.6.** The sequences \( \{y_{n,k}\} = 1 \) and \( \{y_{n,k}\} = -1 \) for each \( n \) and \( k \) are both subsequences of the double sequence whose \( n,k \)th term is \( x_{n,k} = (-1)^n \). In addition to the two subsequences given, every double sequence of 1’s and \(-1\)’s is a subsequence of this \( x \).

**EXAMPLE 2.7.** As another example of a subsequence of a double sequence, we define \( x \) as follows:

\[
x_{n,k} := \begin{cases} 1, & \text{if } n = k, \\ \frac{1}{n}, & \text{if } n < k, \\ n, & \text{if } n > k. \end{cases}
\]  

(2.2)

Then the double sequence

\[
y_{n,k} := \begin{pmatrix} \frac{1}{2} & 4 & \frac{1}{10} & 20 & \cdots \\ 8 & 6 & \frac{1}{12} & 22 & \cdots \\ \frac{1}{18} & \frac{1}{16} & \frac{1}{14} & 24 & \cdots \\ 32 & 30 & 28 & 26 & \cdots \\ \cdots & \cdots & \cdots & \cdots & \cdots \end{pmatrix}
\]  

(2.3)

is clearly a subsequence of \( x \).
**Remark 2.8.** Note that if the double sequence \( x \) contains at most a finite number of unbounded rows and/or columns, then every subsequence of \( x \) is bounded. In addition, the finite number of unbounded rows and/or columns does not affect the \( P \)-convergence or \( P \)-divergence of \( x \) and its subsequences.

**Definition 2.9.** A number \( \beta \) is called a Pringsheim limit point of the double sequence \( x = [x_{n,k}] \) provided that there exists a subsequence \( y = [y_{n,k}] \) of \( [x_{n,k}] \) that has Pringsheim limit \( \beta : P\lim y_{n,k} = \beta \).

**Example 2.10.** Define the double sequence \( x \) by

\[
x_{n,k} := \begin{cases} (-1)^n, & \text{if } n = k, \\ (-2)^n, & \text{if } n = k + 1, \\ 0, & \text{otherwise.} \end{cases}
\]

This double sequence has five Pringsheim limit points, namely \(-2, -1, 0, 1, \) and 2.

**Remark 2.11.** The definition of a Pringsheim limit point can also be stated as follows: \( \beta \) is a Pringsheim limit point of \( x \) provided that there exist two increasing index sequences \( \{n_i\} \) and \( \{k_i\} \) such that \( \lim x_{n_i,k_i} = \beta \).

**Definition 2.12.** A double sequence \( x \) is divergent in the Pringsheim sense (\( P \)-divergent) provided that \( x \) does not converge in the Pringsheim sense (\( P \)-convergent).

**Remark 2.13.** Definition 2.12 can also be stated as follows: a double sequence \( x \) is \( P \)-divergent provided that either \( x \) contains at least two subsequences with distinct finite Pringsheim limit points or \( x \) contains an unbounded subsequence. Also note that, if \( x \) contains an unbounded subsequence then \( x \) also contains a definite divergent subsequence.

**Example 2.14.** This is an example of a convergent double sequence whose terms form an unbounded set

\[
x_{n,k} := \begin{cases} k, & \text{if } n = 1, \\ n, & \text{if } k = 2, \\ 0, & \text{otherwise.} \end{cases}
\]

**Example 2.15.** This is an example of an unbounded divergent double sequence with three finite Pringsheim limit points, namely \(-1, 0, \) and 1:

\[
x_{n,k} := \begin{cases} k + 1, & \text{if } n = 1, \\ (-1)^{n+1}, & \text{if } n = k, \\ 0, & \text{otherwise.} \end{cases}
\]

**Example 2.16.** This is an example of a double sequence which contains an unbounded subsequence

\[
x_{n,k} := \begin{cases} n, & \text{if } n = k, \\ -n, & \text{if } n = k + 1, \\ 0, & \text{otherwise.} \end{cases}
\]
Example 2.17. For an example of a definite divergent sequence take \( x_{n,k} = n \) for each \( n \) and \( k \); then it is also clear that \( x \) contains an unbounded subsequence.

The following propositions are easily verified.

**Proposition 2.18.** If \( x = [x_{n,k}] \) is \( P \)-convergent to \( L \) then \( x \) cannot converge to a limit \( M \), where \( M \neq L \).

**Proposition 2.19.** If \( x = [x_{n,k}] \) is \( P \)-convergent to \( L \), then any subsequence of \( x \) is also \( P \)-convergent to \( L \).

**Remark 2.20.** For an ordinary single-dimensional sequence, any sequence is a subsequence of itself. This, however, is not the case in the two-dimensional plane, as illustrated by the following example.

**Example 2.21.** The sequence

\[
x_{n,k} := \begin{cases} 1, & \text{if } n = k = 0, \\ 1, & \text{if } n = 0, k = 1, \\ 1, & \text{if } n = 1, k = 0, \\ 0, & \text{otherwise} \end{cases}
\]

contains only two subsequences, namely, \( [y_{n,k}] = 0 \) for each \( n \) and \( k \), and

\[
z_{n,k} := \begin{cases} 1, & \text{if } n = k = 0, \\ 0, & \text{otherwise}; \end{cases}
\]

neither subsequences is \( x \).

The following propositions are easily verified.

**Proposition 2.22.** If every subsequence of \( x = [x_{k,l}] \) is \( P \)-convergent, then \( x \) is \( P \)-convergent.

**Proposition 2.23.** The double sequence \( x \) is \( P \)-convergent to \( L \) if and only if every subsequence of \( x \) is \( P \)-convergent to \( L \).

**Definition 2.24.** The double sequence \( y \) contains an \( \epsilon \)-Pringsheim-copy of \( x \) provided that \( y \) contains a subsequence \( y_{n_i,k_j} \) such that \( |y_{n_i,k_j} - x_{i,j}| < \epsilon_{i,j} \), for \( i, j = 1, 2, \ldots \).

**Example 2.25.** Let

\[
x_{n,k} := \begin{cases} (-1)^n, & \text{if } k = n, \\ 0, & \text{otherwise}, \end{cases}
\]

and let \( P\text{-lim}_{n,k} \epsilon_{n,k} = 0 \) with

\[
y_{n,k} := \begin{cases} (-1)^n, & \text{if } k = n, \\ \epsilon_{n,k}, & \text{otherwise}. \end{cases}
\]

Observe that, not only does \( y \) contain an \( \epsilon \)-Pringsheim-copy of \( x \), but \( y \) itself is an \( \epsilon \)-Pringsheim-copy of \( x \).
**Definition 2.26.** The double sequence \( y \) is a stretching of \( x \) provided that there exist two increasing index sequences \( \{ R_i \}_{i=0}^{\infty} \) and \( \{ S_j \}_{j=0}^{\infty} \) of integers such that

\[
y_{n,k} := \begin{cases} 
R_0 = S_0 = 1, \\
x_{n,i}, & \text{if } R_{i-1} \leq k < R_i, \\
x_{j,k}, & \text{if } S_{j-1} \leq n < S_j, \\
i, j = 1, 2, \ldots 
\end{cases}
\] (2.12)

**Remark 2.27.** This definition demonstrates the procedure which is used to construct a stretching of a double sequence \( x \). This procedure uses a sequence of stages to construct the stretching of \( x \). These stages are constructed using a sequence of abutting rows and columns of \( x \). These rows and columns are constructed as follows.

**Stage 1.** Begin by repeating the first row of \( x \) \( R_1 \) times and denote the resulting double sequence by \( y^{1,0} \) then repeat the first column of \( y^{1,0} \) \( S_1 \) times resulting in \( y^{1,1} \).  

**Stage 2.** Begin by repeating the \( R_1 + 1 \) row of \( y^{1,1} \), \( R_2 - R_1 \) times which yields \( y^{2,1} \) then repeat the \( S_1 + 1 \) column of \( y^{2,1} \), \( S_2 - S_1 \) times which yields \( y^{2,2} \).  

\[ \vdots \]

**Stage \( i \).** Begin by repeating the \( 1 + \sum_{p=1}^{i-1} R_p \) row of \( y^{i-1,i-1} \), \( R_i - R_{i-1} \) times which yields \( y^{i,i-1} \) then repeat the \( 1 + \sum_{q=1}^{i-1} S_q \) column of \( y^{i,i-1} \), \( S_i - S_{i-1} \) times which yields \( y^{i,i} \). Note that in each stage we repeat the number of rows and then repeat the number of columns. However the resulting stretching \( y \) of \( x \) is the same, if we first repeat the number of columns and then repeat the numbers of rows. Also note that every sequence itself is a stretching of itself and the sequences that induce this kind of stretching are \( R_i = i \) and \( S_j = j \).

**Example 2.28.** The sequence

\[
\begin{align*}
&x_{1,1} \quad x_{1,1} \quad x_{1,1} \quad x_{1,2} \quad x_{1,2} \quad x_{1,2} \quad x_{1,3} \quad x_{1,3} \quad x_{1,3} \quad \cdots \\
&x_{1,1} \quad x_{1,1} \quad x_{1,1} \quad x_{1,2} \quad x_{1,2} \quad x_{1,2} \quad x_{1,3} \quad x_{1,3} \quad x_{1,3} \quad \cdots \\
&x_{1,1} \quad x_{1,1} \quad x_{1,1} \quad x_{1,2} \quad x_{1,2} \quad x_{1,2} \quad x_{1,3} \quad x_{1,3} \quad x_{1,3} \quad \cdots \\
&x_{2,1} \quad x_{2,1} \quad x_{2,1} \quad x_{2,2} \quad x_{2,2} \quad x_{2,2} \quad x_{2,3} \quad x_{2,3} \quad x_{2,3} \quad \cdots \\
&x_{2,1} \quad x_{2,1} \quad x_{2,1} \quad x_{2,2} \quad x_{2,2} \quad x_{2,2} \quad x_{2,3} \quad x_{2,3} \quad x_{2,3} \quad \cdots \\
&x_{2,1} \quad x_{2,1} \quad x_{2,1} \quad x_{2,2} \quad x_{2,2} \quad x_{2,2} \quad x_{2,3} \quad x_{2,3} \quad x_{2,3} \quad \cdots \\
&x_{3,1} \quad x_{3,1} \quad x_{3,1} \quad x_{3,2} \quad x_{3,2} \quad x_{3,2} \quad x_{3,3} \quad x_{3,3} \quad x_{3,3} \quad \cdots \\
&x_{3,1} \quad x_{3,1} \quad x_{3,1} \quad x_{3,2} \quad x_{3,2} \quad x_{3,2} \quad x_{3,3} \quad x_{3,3} \quad x_{3,3} \quad \cdots \\
&x_{3,1} \quad x_{3,1} \quad x_{3,1} \quad x_{3,2} \quad x_{3,2} \quad x_{3,2} \quad x_{3,3} \quad x_{3,3} \quad x_{3,3} \quad \cdots \\
&\vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots 
\end{align*}
\] (2.13)

is a stretching of \( x \) induced by \( R_i = 3i \) and \( S_j = 3j \).

3. **Main results.** The following theorem is given its name because of its similarity to the copy theorem of Dawson in [1].

**Theorem 3.1** (extended copy theorem). If each of \( A \) and \( T \) is an RH-regular matrix, and \( x \) is any bounded double complex sequence with \( \epsilon \) being any bounded positive term
double sequence with \( P \cdot \lim_{i,j} c_{i,j} = 0 \), then there exists a stretching \( \gamma \) of \( x \) such that \( T(Ay) \) exists and contains an \( \varepsilon \)-Pringsheim-copy of \( x \).

**Proof.** We begin by introducing a few notations which are used only in this proof. Let

\[
\|A\| := \sup_{m,n > \hat{B}} \left( \sum_{k,l} |a_{m,n,k,l}| \right) < K_A, \quad \|T\| := \sup_{m,n > \hat{B}} \left( \sum_{k,l} |t_{m,n,k,l}| \right) < K_T,
\]

\[
M_{i,j} := 1 + \sum_{k,l=1}^{i,j} |x_{k,l}|, \quad \delta_{i,j} := \min_{i,j} \left\{ \frac{\epsilon_{k,l}}{1} \leq k \leq i \cup 1 \leq l \leq j \right\},
\]

\[
K := K_A + K_T + \max_{i,j} \left\{ \frac{\epsilon_{k,l}}{1} \leq k \leq i \cup 1 \leq l \leq j \right\} + 1, \quad Q_{i,j} := KM_{i,j} + 1,
\]

\[
c_{i,j}(r,s) := \left\{ \begin{array}{l}
\left( \frac{(k,l)}{1} \leq k < r_i \cup 1 \leq l < s_j \right), \\
\end{array} \right.
\]

\[
\hat{c}_{i,j}(r,s) := \left\{ \begin{array}{l}
\left( \frac{(k,l)}{1} \leq k < \infty \cup s_j \leq l < \infty \right), \\
\end{array} \right.
\]

Then by \( (RH_2) \) there exist \( m_{\alpha_1} \) and \( n_{\beta_1} \) such that for \( m > m_{\alpha_1} > \hat{B} \) and \( n > n_{\beta_1} > \hat{B} \), where \( \hat{B} \) is defined by the sixth \( RH \)-condition,

\[
\left| \sum_{k,l=1}^{\infty,\infty} a_{m,n,k,l} - 1 \right| < \frac{\delta_{\alpha_1,\beta_1}}{16Q_{\alpha_1,\beta_1}}.
\]

Also by \( (RH_1) \) and \( (RH_2) \) there exist \( a_{\alpha_1} \) and \( b_{\beta_1} \) such that

\[
\sum_{(k,l) \in e_{\alpha_1,\beta_1}(m,n)} |t_{a_{\alpha_1,b_{\beta_1},k,l}| < \frac{\delta_{\alpha_1,\beta_1}}{8Q_{\alpha_1,\beta_1}}, \quad \sum_{k,l=1}^{\infty,\infty} t_{a_{\alpha_1,b_{\beta_1},k,l}} - 1 \right| < \frac{\delta_{\alpha_1,\beta_1}}{8Q_{\alpha_1,\beta_1}}.
\]

In addition, there exist \( \tilde{m}_{\alpha_1}, \tilde{n}_{\beta_1}, \alpha_2, \) and \( \beta_2 \) such that if \( 1 \leq \psi \leq a_{\alpha_1} \) and \( 1 \leq \omega \leq b_{\beta_1} \), then

\[
\sum_{(k,l) \in \tilde{e}_{\alpha_1,\beta_1}(m,n)} |t_{\psi,\omega,k,l}| < \frac{\delta_{\alpha_1,\beta_1}}{16Q_{\alpha_2,\beta_2}}.
\]

Also, there exist \( r_{\alpha_1} > 1 \) and \( s_{\beta_1} > 1 \) such that if \( 1 \leq m \leq \tilde{m}_{\alpha_1} \) and \( 1 \leq n \leq \tilde{n}_{\beta_1} \) then

\[
\sum_{(k,l) \in \tilde{e}_{\alpha_1,\beta_1}(r,s)} |a_{m,n,k,l}| \leq \frac{\delta_{\alpha_1,\beta_1}}{16Q_{\alpha_2,\beta_2}}.
\]

Now, without loss of generality, we set \( \alpha_p = p \) and \( \beta_q = q \). Having chosen

\[
\left\{ \begin{array}{l}
m_p, \tilde{m}_p, a_p, r_p \\
\end{array} \right\}^{i-1,j-1} \quad \left\{ \begin{array}{l}
n_q, \tilde{n}_q, b_q, s_q \\
\end{array} \right\}_{p=q=0}^{i-1,j-1}
\]

with \( m_0 = n_0 = \tilde{m}_0 = \tilde{n}_0 = a_0 = b_0 = r_0 = s_0 = 1 \), now choose \( m_i > \tilde{m}_{i-1} \) and \( n_j > \tilde{n}_{j-1} \) such that if \( m > m_i \) and \( n > n_j \) then

\[
\sum_{(k,l) \in \tilde{e}_{i-1,j-1}(r,s)} |a_{m,n,k,l} - 1| < \frac{\delta_{i,j}}{16Q_{i,j}2^{1+j}}.
\]
ANALOGUES OF SOME TAUBERIAN THEOREMS FOR STRETCHINGS

\[ \sum_{(k,l) \in c_{l-1,j-1}(r,s)} |a_{m,n,k,l}| < \frac{\delta_{i,j}}{8Q_{l-1,j-1}2^{i+j}}. \] (3.8)

Also choose \( a_i > a_{i-1} \) and \( b_j > b_{j-1} \) such that

\[ \sum_{(k,l) \in c_{l,j}(m,n)} |t_{a_i,b_j,k,l}| < \frac{\delta_{i,j}}{8Q_{l,j}}, \quad \sum_{(k,l) \in c_{l,j}(m,n)} t_{a_i,b_j,k,l} \leq \frac{\delta_{i,j}}{8Q_{l,j}}. \] (3.9)

Next choose \( \tilde{m}_i > m_i \) and \( \tilde{n}_j > n_j \) such that if \( 1 \leq \varphi \leq a_i \) and \( 1 \leq \omega \leq b_j \) then

\[ \sum_{(k,l) \in c_{l,j}(\tilde{m},\tilde{n})} |t_{\varphi,\omega,k,l}| < \frac{\delta_{i,j}}{2^{2+i+j}Q_{l+1,j+1}}. \] (3.10)

Then choose \( r_i > r_{i-1} \) and \( s_j > s_{j-1} \) such that if \( 1 \leq m \leq \tilde{m}_i \) and \( 1 \leq n \leq \tilde{n}_j \) then

\[ \sum_{(k,l) \in \bar{c}_{l,j}(r,s)} |a_{m,n,k,l}| < \frac{\delta_{i,j}}{2^{4+i+j}Q_{l+1,j+1}}, \] (3.11)

where \( m_i, n_j, \tilde{m}_i, \tilde{n}_j, r_i, \) and \( s_j \) are chosen using \((RH_1), (RH_2), (RH_3), \) and \((RH_4)\) such that if \( 1 \leq p \leq j-1 \) and \( 1 \leq q \leq i-1 \) the following is obtained:

\[ \left| \sum_{(k,l) \in \bar{c}_{l,j}(r,s)} a_{m,n,k,l} \right| \leq \frac{\delta_{i,j}}{8Q_{l,q}2^{p+q}}, \quad \left| \sum_{(k,l) \in \bar{c}_{l,j}(r,s)} a_{m,n,k,l} \right| \leq \frac{\delta_{i,j}}{8Q_{l,q}2^{i+j}}. \] (3.12)

Therefore by (3.9) and (3.10) we have

\[ \left| \sum_{(k,l) \in \bar{c}_{l,j}(\tilde{m},\tilde{n})} t_{a_i,b_j,k,l} \right| \leq \frac{\delta_{i,j}}{4Q_{l,j}}. \] (3.13)

and by (3.7), (3.8), and (3.11) we also obtain

\[ \left| \sum_{(k,l) \in \bar{c}_{l,j}(r,s)} a_{m,n,k,l} \right| \leq \frac{\delta_{i,j}}{8Q_{l,j}2^{i+j}}. \] (3.14)

where \( m_i \leq m \leq \tilde{m}_i \) and \( n_j \leq n \leq \tilde{n}_j \). Let \( \{y_{k,l}\} \) be the stretching of \( x \) induced by \( \{r_i\} \) and \( \{s_j\} \). Since

\[
(Ay)_{m,n} - x_{i,j} = \sum_{k,l=1}^{r_{i-1},s_{j-1}} a_{m,n,k,l}y_{k,l} + \sum_{(k,l) \in \bar{e}_{l,j}(r,s)} a_{m,n,k,l}y_{k,l} - x_{i,j} + \sum_{p,q=i-1,j-1} a_{m,n,k,l}y_{k,l},
\]

(3.15)

if \( i,j > 1 \), with \( m_i \leq m \leq \tilde{m}_i \) and \( n_j \leq n \leq \tilde{n}_j \) the following is obtained:

\[ \left| \sum_{k,l=1}^{r_{i-1},s_{j-1}} a_{m,n,k,l}y_{k,l} \right| \leq \max \left\{ \frac{|x_{k,l}|}{1} \leq k \leq i-1 \cup 1 \leq l \leq j-1 \right\} \sum_{k,l=1}^{r_{i-1},s_{j-1}} |a_{m,n,k,l}y_{k,l}|. \] (3.16)
By (3.8),
\[ \left| \sum_{k,l=1}^{r_{j-1}-1} a_{m,n,k,l} y_{k,l} \right| \leq \max \left\{ \frac{|x_{k,l}|}{1} \leq k \leq i-1 \cup 1 \leq l \leq j-1 \right\} \frac{\delta_{i,j}}{8Q_{i-1,j-1}}. \] (3.17)

Since
\[ Q_{i-1,j-1} = K \left( 1 + \sum_{k,l=1}^{i-1,j-1} |x_{k,l}| \right) + 1 \geq K \max \left\{ \frac{|x_{k,l}|}{1} \leq k \leq i-1 \cup 1 \leq l \leq j-1 \right\}, \] (3.18)

the following holds:
\[ \left| \sum_{k,l=1}^{r_{j-1}-1} a_{m,n,k,l} y_{k,l} \right| \leq \frac{\delta_{i,j}}{8K}, \] (3.19)

the following also is obtained:
\[ \left| \sum_{p,q=0}^{i,j} a_{m,n,k,l} y_{k,l} \right| \leq \sum_{p,q=0}^{i,j} |x_{k,l}| \sum_{(k,l) \in \overline{B}_{p,q}(r,s)} |a_{m,n,k,l}| \]
\[ \leq \frac{\delta_{i,j}}{24K} \sum_{p,q=0}^{i,j} \frac{1}{2^{p+q}} \leq \frac{\delta_{i,j}}{8K}, \] (3.20)

because
\[ \sum_{k,l=r_{p,q}}^{\infty} a_{m,n,k,l} \leq \frac{\delta_{p-1,q-1}}{24+p+qQ_{p,q}}, \quad \frac{|x_{p,q}|}{Q_{p,q}} < \frac{1}{K}. \] (3.21)

Therefore by (3.11),
\[ \left| \sum_{(k,l) \in B_{i,j}(r,s)} a_{m,n,k,l} y_{k,l} - x_{i,j} \right| \leq \sum_{q=1}^{i-1} |x_{i,q}| \sum_{(k,l) \in B_{p,q}(r,s)} a_{m,n,k,l} \]
\[ + \sum_{p=1}^{j-1} |x_{p,j}| \sum_{(k,l) \in B_{p,j}(r,s)} a_{m,n,k,l} \]
\[ + |x_{i,j}| \sum_{(k,l) \in B_{i,j}(r,s)} a_{m,n,k,l} - 1 \]
\[ \leq \sum_{p,q=0}^{i,j} |x_{p,q}| \frac{\delta_{p,q}}{2^{p+q}+3} \leq \frac{\delta_{i,j}}{K8} \sum_{p,q=1}^{i,j} \frac{1}{2^{p+q}} = \frac{\delta_{i,j}}{K2}. \] (3.22)

Therefore,
\[ |(Ay)_{m,n} - x_{i,j}| \leq \frac{\delta_{i,j}}{K8} + \frac{\delta_{i,j}}{K4} + \frac{\delta_{i,j}}{K2} < \frac{\delta_{i,j}}{2K}. \] (3.23)
Note that the inequality (3.23) is true for \( m_1 \leq m \leq \bar{m}_1 \) and \( n_1 \leq n \leq \bar{n}_1 \), and also this inequality is true for \( i, j \geq 1 \) with \( m_i \leq m \leq \bar{m}_i \) and \( n_j \leq n \leq \bar{n}_j \). Hence

\[
(Ay)_{m,n} = x_{i,j} + u_{i,j},
\]

where \(|u_{i,j}| \leq \delta_{i,j}/2K\). Note that if \( \bar{m}_{i-1} \leq m \leq \bar{m}_i \) and \( \bar{n}_{j-1} \leq n \leq \bar{n}_j \), then the following is obtained:

\[
| (Ay)_{m,n} | \leq \sum_{k,l=1}^{r_i-1,s_j-1} a_{m,n,k,l} y_{k,l} + \sum_{p,q=i+1,j+1}^{\infty,\infty} \sum_{k,l=b_{p,q}(r,s)} a_{m,n,k,l} y_{k,l} \\
\leq \max \left\{ \frac{|x_{k,l}|}{1} \leq k \leq i \leq l \leq j \right\} \sum_{k,l=1}^{r_i-1,s_j-1} |a_{m,n,k,l}| \\
+ \sum_{p,q=i+1,j+1}^{\infty,\infty} |x_{k,l}| \sum_{k,l=b_{p,q}(r,s)} |a_{m,n,k,l}| \\
\leq K m_{i,j} + \sum_{p,q=i+1,j+1}^{\infty,\infty} \frac{1}{2^{p+q}Q_{p+1,q+1}} \delta_{p,q} \\
\leq K m_{i,j} + \frac{\delta_{i,j}}{K4} \sum_{p,q=i+1,j+1}^{\infty,\infty} \frac{1}{2^{p+q}} \\
\leq K m_{i,j} + 1 = Q_{i,j}.
\]

Also, if \( m_{i-1} \leq m \leq m_i \) and \( n_{j-1} \leq n \leq n_j \) then

\[
\sum_{k,l=1}^{\infty,\infty} a_{m,n,k,l} y_{k,l} \leq | (Ay)_{m,n} - x_{i,j} | + |x_{i,j}| \\
\leq \delta_{i,j}/2K + K m_{i,j} \leq K m_{i,j} + 1 = Q_{i,j}.
\]

By using (3.25) we now show the existence of \( T(Ay) \). If \( a_{i-1} < m \leq a_i \) and \( b_{j-1} < n \leq b_j \) then

\[
\sum_{k,l=\bar{m}_i+1,\bar{n}_j+1}^{\infty,\infty} t_{m,n,k,l}(Ay)_{k,l} \leq \sum_{r,s=i,j}^{\infty,\infty} \sum_{(p,q) \in b_{r+1,s+1}}^{\infty,\infty} t_{m,n,p,q} (Ay)_{p,q} \\
\leq \sum_{r,s=i,j}^{\infty,\infty} Q_{r+1,s+1} \sum_{(p,q) \in b_{r+1,s+1}}^{\infty,\infty} t_{m,n,p,q} \\
\leq \sum_{r,s=i,j}^{\infty,\infty} Q_{r+1,s+1} 2^{2^{r+s}Q_{r+1,s+1}} \delta_{r,s} \\
\leq \delta_{i,j} 1/4 \sum_{r,s=1}^{\infty,\infty} \frac{1}{2^{2r+s}} < \delta_{i,j}/4.
\]
Therefore \( T(Ay) \) exists. Also, by (3.25) we now show that \( T(Ay) \) contains an \( \epsilon \)-Pringsheim-copy of \( x \). First note that

\[
\sum_{k,l=1}^{\infty,\infty} t_{a_i,b_j,k,l}(Ay)_{k,l} - x_{i,j} \leq \sum_{k,l=1}^{m_i-1,n_j-1} |t_{a_i,b_j,k,l}(Ay)_{k,l}|
\]

\[
+ \sum_{(k,l) \in \tilde{h}_{i,j}(r,s)} |t_{a_i,b_j,k,l}(Ay)_{k,l} - x_{i,j}|
\]

\[
+ \sum_{k,l=\tilde{m}_i+1,\tilde{n}_j+1}^{\infty,\infty} t_{m,n,k,l}(Ay)_{k,l},
\]

with

\[
\sum_{k,l=1}^{m_i-1,n_j-1} |t_{a_i,b_j,k,l}(Ay)_{k,l}| = \sum_{k,l=1}^{m_i-1,n_j-1} |t_{a_i,b_j,k,l}| Q_{i,j} \leq Q_{i,j} \frac{\delta_{i,j}}{8Q_{i,j}} = \frac{\delta_{i,j}}{8}, \quad (3.29)
\]

\[
\sum_{(k,l) \in \tilde{h}_{i,j}(r,s)} |t_{a_i,b_j,k,l}(Ay)_{k,l} - x_{i,j}| \leq |x_{i,j}| \sum_{(k,l) \in \tilde{h}_{i,j}(r,s)} |t_{a_i,b_j,k,l} - 1|
\]

\[
+ \sum_{(k,l) \in \tilde{h}_{i,j}(r,s)} |t_{a_i,b_j,k,l} u_{i,j}|
\]

\[
\leq \frac{|x_{i,j}|}{4} \frac{\delta_{i,j}}{Q_{i,j}} + \frac{\delta_{i,j}}{4K} \sum_{(k,l) \in \tilde{h}_{i,j}(r,s)} |t_{a_i,b_j,k,l}|
\]

\[
\leq \frac{\delta_{i,j}}{2}, \quad (3.30)
\]

\[
\sum_{k,l=\tilde{m}_i+1,\tilde{n}_j+1}^{\infty,\infty} t_{m,n,k,l}(Ay)_{k,l} \leq \sum_{r,s=i_j}^{\infty,\infty} \sum_{(p,q) \in \tilde{h}_{r+1,s+1}(m,n)} |t_{a_i,b_j,p,q}(Ay)_{p,q}|
\]

\[
\leq \sum_{r,s=i_j}^{\infty,\infty} Q_{r+1,s+1} \sum_{(p,q) \in \tilde{h}_{r+1,s+1}(m,n)} |t_{a_i,b_j,p,q}|
\]

\[
\leq \sum_{r,s=i_j}^{\infty,\infty} Q_{r+1,s+1} \frac{\delta_{r,s}}{2^{2r+s}Q_{r+1,s+1}} \leq \frac{\delta_{i,j}}{4}, \quad (3.31)
\]

Hence,

\[
\sum_{k,l=1}^{\infty,\infty} t_{m,n,k,l}(Ay)_{k,l} - x_{i,j} \leq \frac{\delta_{i,j}}{4} + \frac{\delta_{i,j}}{2} + \frac{\delta_{i,j}}{8} < \delta_{i,j} \leq \epsilon_{i,j}, \quad (3.32)
\]

This completes the proof of the extended copy theorem.
The next two results are immediate corollaries of the extended copy theorem.

**Corollary 3.2.** If $T$ is any RH-regular matrix summability method and $A$ is an RH-regular matrix such that $Ay$ is $T$-summable for every stretching $y$ of $x$, then $x$ is $P$-convergent.

**Corollary 3.3.** If $T$ is any RH-regular matrix summability method and $A$ is an RH-regular matrix such that $Ay$ is absolutely $T$-summable for every stretching $y$ of $x$, then $x$ is $P$-convergent.

**Acknowledgement.** This paper is based on the author’s doctoral dissertation, written under the supervision of Prof. J. A. Fridy at Kent State University. I am extremely grateful to my advisor Prof. Fridy for his encouragement and advice.

Special Issue on
Intelligent Computational Methods for
Financial Engineering

Call for Papers

As a multidisciplinary field, financial engineering is becoming increasingly important in today’s economic and financial world, especially in areas such as portfolio management, asset valuation and prediction, fraud detection, and credit risk management. For example, in a credit risk context, the recently approved Basel II guidelines advise financial institutions to build comprehensible credit risk models in order to optimize their capital allocation policy. Computational methods are being intensively studied and applied to improve the quality of the financial decisions that need to be made. Until now, computational methods and models are central to the analysis of economic and financial decisions.

However, more and more researchers have found that the financial environment is not ruled by mathematical distributions or statistical models. In such situations, some attempts have also been made to develop financial engineering models using intelligent computing approaches. For example, an artificial neural network (ANN) is a nonparametric estimation technique which does not make any distributional assumptions regarding the underlying asset. Instead, ANN approach develops a model using sets of unknown parameters and lets the optimization routine seek the best fitting parameters to obtain the desired results. The main aim of this special issue is not to merely illustrate the superior performance of a new intelligent computational method, but also to demonstrate how it can be used effectively in a financial engineering environment to improve and facilitate financial decision making. In this sense, the submissions should especially address how the results of estimated computational models (e.g., ANN, support vector machines, evolutionary algorithm, and fuzzy models) can be used to develop intelligent, easy-to-use, and/or comprehensible computational systems (e.g., decision support systems, agent-based system, and web-based systems).

This special issue will include (but not be limited to) the following topics:

- **Application fields**: asset valuation and prediction, asset allocation and portfolio selection, bankruptcy prediction, fraud detection, credit risk management
- **Implementation aspects**: decision support systems, expert systems, information systems, intelligent agents, web service, monitoring, deployment, implementation

Authors should follow the Journal of Applied Mathematics and Decision Sciences manuscript format described at the journal site http://www.hindawi.com/journals/jamds/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/, according to the following timetable:
