ABSTRACT: Sufficient conditions are given under which a sequence of independent random elements taking values in a Banach space satisfy the Hsu and Robbins law of large numbers. The complete convergence of random indexed sums of random elements is also considered.

KEY WORDS AND PHRASES: complete convergence, strong law of large numbers, random elements, Banach space, random indexed sums.

1991 AMS SUBJECT CLASSIFICATION CODES. 60F15, 60B12.

1. INTRODUCTION

Let \( \{X_n, n \geq 1\} \) be a sequence of independent random elements taking values in a separable Banach space \((B, \|\cdot\|)\). Put \( S_n = \sum_{i=1}^{n} X_i \). A sequence \( \{X_n, n \geq 1\} \) of random elements is said to satisfy the law of large numbers of Hsu-Robbins type if for any given \( \varepsilon > 0 \)

\[
\sum_{n=1}^{\infty} P(\|S_n\| \geq \varepsilon n) < \infty.
\]

Hsu and Robbins [1] proved that the existence of the second moment of independent, identically distributed random variables for which \( EX_1 = 0 \), implies the Hsu-Robbins type law of large numbers. Erdős [2] showed that the existence of the second moment of independent, identically distributed random variables and the condition \( EX_1 = 0 \) is also the necessary one for the Hsu-Robbins type law of large numbers. Considerations concerning (1.1) for sequences and subsequences of independent, identically distributed random variables can be found in Katz [3], Baum, Katz [4], Asmussen, Kurtz [5] and Gut [6]. The results in those cases are given under the assumption when there exists a finite moment of order \( r \) \((1 < r \leq 2)\).

Some conditions, which guarantee the convergence of (1.1) for sequences and subsequences in the case nonidentically distributed random variables can be found in Duncan, Szynal [7], Bartoszyński, Puri [8] and Kuczmaszewska, Szynal [9], [10]. For instance, it has been shown in Duncan, Szynal [7] that if a sequence \( \{X_n, n \geq 1\} \) of independent random variables with \( EX_n = 0 \) and
The following example shows that the assumptions (i)-(iv) which are sufficient conditions for (1.1) in the case of independent random variables are not sufficient if we consider sequences of independent random elements taking values in Banach space $B$.

**EXAMPLE.** Let denote the separable Banach space $l^1$ and $e^n$ denote the element having 1 for its $n$-th coordinate and 0 in the other coordinates. Let $\{X_n, n \geq 1\}$ be a sequence of independent random variables defined as follows $P[\xi_n = 1] = 1/2$, $n \geq 1$, and define $X_n = \xi_n e^n$, $n \geq 1$. Thus $\{X_n, n \geq 1\}$ is a sequence of independent $l^1$-valued random elements with symmetric distributions, such that $EX_n = 0$, $E\|X_n\|^2 = 1$, $E\|X_n\|^4 = 1$, $n \geq 1$, and $\{X_n, n \geq 1\}$ satisfies the assumptions (i)-(iv) but $\|\sum_{n=1}^{\infty} X_n\| = n^{-1} \sum_{n=1}^{\infty} 1 = 1$, which shows that the condition $\sum_{n=1}^{\infty} P[\|S_n\| \geq n \varepsilon] < \infty$ does not hold for all $\varepsilon > 0$.

The aim of this note is to give sufficient conditions, which guarantee the Hsu-Robbins type of large numbers for independent random elements taking values in Banach space $B$.

2. PRELIMINARIES

We need now an extension of Hoffman-Jörgensen inequality (cf. Hoffman- Jörgensen [11], and Gut [6]).

**LEMMA 1.** Let $\{X_n, n \geq 1\}$ be a sequence of independent random elements taking values in a real separable Banach space $(B, \|\|)$ with a symmetric distribution. Then for every $j = 1, 2, \ldots, n$ and $t > 0$

$$P[\|S_n\| \geq 3^n t] \leq C_j \sum_{i=1}^{n} P[\|X_i\| \geq t] + D_j (P[\|S_n\| \geq t])^{2^j},$$

(2.1)

where $C_j$ and $D_j$ are positive constants depending only on $j$. 
Moreover, $P[\|S_n\| \geq 3t, T = i] = \sum_{i=1}^{n} P[\|S_n\| \geq 3t, T = i]$

$= \sum_{i=1}^{n} P[\|S_n\| \geq 3t, \|S_i\| < t, \ldots, \|S_{i-1}\| < t, \|S_i\| \geq t]$

$= \sum_{i=1}^{n} P[\|S_n - S_i + S_{i-1} + X_i\| \geq 3t, \|S_i\| < t, \ldots, \|S_{i-1}\| < t, \|S_i\| \geq t]$

$\leq \sum_{i=1}^{n} P[\|S_n - S_i\| \geq 2t - \|X_i\|, \|S_i\| < t, \ldots, \|S_{i-1}\| < t, \|S_i\| \geq t]$

$\leq \sum_{i=1}^{n} P[\|S_n - S_i\| \geq 2t - \|X_i\|, T = i] \leq \sum_{i=1}^{n} P[\|X_i\| \geq t, T = i]$

$+ \sum_{i=1}^{n} P[\|S_n - S_i\| \geq t, T = i] \leq \sum_{i=1}^{n} P[\|X_i\| \geq t]$

$\leq \sum_{i=1}^{n} P[\|X_i\| \geq t] \cdot P[T = i].$

Moreover,

$P[\|S_n - S_i\| \geq t] \leq P[\max(\|S_n - S_i\|, \|S_n - S_i + S_i\|) \geq t]$

$\leq 2P[\|S_n\| \geq t],$

as $S_n - S_i$ and $S_i$ are independent, symmetrically distributed random elements. Hence

$P[\|S_n\| \geq 3t] \leq \sum_{i=1}^{n} P[\|X_i\| \geq t] + 2P[\|S_n\| \geq t] \cdot \sum_{i=1}^{n} P[T = i]$

$\leq \sum_{i=1}^{n} P[\|X_i\| \geq t] + 2P[\|S_n\| \geq t] \cdot P[\max_{1 \leq j \leq n} \|S_j\| \geq t]$

$\leq \sum_{i=1}^{n} P[\|X_i\| \geq t] + 4(P[\|S_n\| \geq t])^2.$

By the induction principle, we get

$P[\|S_n\| \geq 3^{j+1}t] = P[\|S_n\| \geq 3 \cdot 3^j t]$

$\leq \sum_{i=1}^{n} P[\|X_i\| \geq 3^j t] + 4(P[\|S_n\| \geq 3^j t])^2$

$\leq \sum_{i=1}^{n} P[\|X_i\| \geq t] + 4(C_j \sum_{i=1}^{n} P[\|X_i\| \geq t] + D_j \cdot P[\|S_n\| \geq 3^j t] \cdot 2^j [\|S_n\| \geq 3^j t])^2$

$\leq C_{j+1} \sum_{i=1}^{n} P[\|X_i\| \geq t] + D_{j+1}(P[\|S_n\| \geq t])^{2^{j+1}}.$

Moreover, we shall use the following lemmas.
LEMMA 2. (Yurinski [12]) Let $X_1, \ldots, X_n$ be independent $B$-valued random elements with $E\|X_i\| < \infty$ ($i = 1, \ldots, n$). Let $\mathcal{F}_k$ be the $\sigma$-field generated by $(X_1, \ldots, X_k)$, $(k = 1, \ldots, n)$ and let $\mathcal{F}_0 = \{\emptyset, \Omega\}$. Then for $1 \leq k \leq n$

$$|E(||S_n|||\mathcal{F}_k) - E(||S_n|||\mathcal{F}_{k-1})| \leq \|X_k\| + E\|X_k\|. \tag{2.2}$$

LEMMA 3. (Loève [13]) For every $\varepsilon > 0$

$$P[\|X - m d X\| \geq \varepsilon] \leq 2 \cdot P[\|X\| \geq \varepsilon]. \tag{2.3}$$

$$P[\sup_{j \leq n} \|X_j - m d X_j\| \geq \varepsilon] \leq 2 \cdot P[\sup_{j \leq n} \|X_j\| \geq \varepsilon]. \tag{2.4}$$

where $X^*$ is a symmetrized version of $X$.

In what follows we shall use the strong law of large numbers for a sequence of independent, identically distributed random elements $\{X_n, n \geq 1\}$ in a separable Banach space given in Taylor [14].

THEOREM. Let $\{X_n, n \geq 1\}$ be a sequence of independent identically distributed $B$-valued random elements such that $E\|X_1\| < \infty$.

Then $\limsup_{n \to \infty} \frac{1}{n} \sum_{i=1}^{n} X_i - EX_1 = 0$ a.s. as $n \to \infty$.

3. RESULTS

THEOREM 1. Let $\{X_n, n \geq 1\}$ be a sequence of independent, symmetrically distributed, $B$-valued random elements. Suppose that $\{n_k, k \geq 1\}$ is a strictly increasing sequence of positive integers. If for some positive integer $j$ and any given $\varepsilon > 0$

(i) \[ \sum_{k=1}^{\infty} \sum_{i=1}^{n_k} P[\|X_i\| \geq n_k \varepsilon / 2^j] < \infty, \]

(ii) \[ \sum_{k=1}^{\infty} \left( n_k^{-4} \sum_{i=1}^{n_k} E\|X_i\|^4 I[\|X_i\| < n_k \varepsilon]\right) 2^j < \infty, \]

(iii) \[ \sum_{k=1}^{\infty} \left( n_k^{-4} \sum_{i=2}^{n_k} E\|X_i\|^2 I[\|X_i\| < n_k \varepsilon]\right) \sum_{i=1}^{m-1} E\|X_i\|^2 I[\|X_i\| < n_k \varepsilon] 2^j < \infty, \]

then \[ \sum_{k=1}^{\infty} P[\|S_{n_k}\| \geq n_k \varepsilon] < \infty \]

iff \[ \frac{\|S_{n_k}\|}{n_k} \to 0 \text{ in probability as } k \to \infty. \tag{3.1} \]

PROOF. It is enough to show that under the conditions (i)-(iv) $\|S_{n_k}/n_k\| \to 0$ in probability as $k \to \infty$ implies that $\sum_{k=1}^{\infty} P[\|S_{n_k}\| \geq n_k \varepsilon] < \infty$.

Put $X'_j = X_j I[\|X_j\| < n_k \varepsilon]$, $S'_n = \sum_{i=1}^{n} X'_i$ and $Y_{n_k,i} = E(||S'_n|||\mathcal{F}_i) - E(||S'_{n_k}|||\mathcal{F}_{i-1})$ where $\mathcal{F}_i = \sigma(X'_1, X'_2, \ldots, X'_i)$ and $\mathcal{F}_0 = \{\emptyset, \Omega\}$. Then we have
\[ P[\|S_{n_k}\| \geq n_k \varepsilon] \leq C \sum_{k=1}^{n_k} P[\|X_i\| \geq n_k \varepsilon/3'] + D_{j}(P[\|S_{n_k}\| \geq n_k \varepsilon/3'])^{2^j}. \]

Moreover,
\[
\sum_{k=1}^{\infty} \left( P[\|S_{n_k}\| \geq n_k \varepsilon/3'] \right)^{2^j} \leq 2^{2^{j+1}} \left\{ \sum_{k=1}^{n_k} \left( \sum_{i=1}^{m-1} P[\|X_i\| \geq n_k \varepsilon/3'] \right)^{2^j} + \sum_{k=1}^{\infty} \left( P[\|S_{n_k}'\| \geq n_k \varepsilon/3'] \right)^{2^j} \right\}.
\]

Note that \( \|S_{n_k}'\| - E\|S_{n_k}'\| = \sum_{i=1}^{n_k} Y_{n_k,i} \) and
\[
\sum_{k=1}^{\infty} \left( P[\|S_{n_k}'\| - E\|S_{n_k}'\| \geq n_k \varepsilon/3'] \right)^{2^j} = \sum_{k=1}^{\infty} \left( P\left[ \left( \sum_{i=1}^{n_k} Y_{n_k,i} \right)^2 \geq n_k^2 (\varepsilon/3')^2 \right] \right)^{2^j} \leq \sum_{k=1}^{\infty} \left( P\left[ \sum_{i=1}^{n_k} Y_{n_k,i}^2 \geq n_k^2 (\varepsilon/3')^2 \right] \right)^{2^j} + \sum_{k=1}^{\infty} \left( P\left[ \sum_{m=2}^{m-1} Y_{n_k,m} \sum_{i=1}^{n_k} Y_{n_k,i} \geq n_k^2 (\varepsilon/3')^2 / 4 \right] \right)^{2^j}.
\]

Now putting \( Z_{n_k,i} = Y_{n_k,i}^2 - EY_{n_k,i}^2 \) and using the inequality (2.2) we get for \( \varepsilon' = (\varepsilon/3')^2/2 \)
\[
\sum_{k=1}^{\infty} \left( P\left[ \sum_{i=1}^{n_k} Z_{n_k,i} \right] \right)^{2^j} \leq (\varepsilon')^{-2^{j+1}} \sum_{k=1}^{\infty} \left( n_k^{-4} E \left| \sum_{i=1}^{n_k} Z_{n_k,i} \right|^2 \right)^{2^j} \leq (\varepsilon')^{-2^{j+1}} \sum_{k=1}^{\infty} \left( n_k^{-4} \sum_{i=1}^{n_k} EY_{n_k,i}^4 \right)^{2^j} \leq (\varepsilon')^{-2^{j+1}} \cdot 2^{2^{j+2}} \sum_{i=1}^{\infty} \left( n_k^{-4} \sum_{i=1}^{n_k} E\|X_i'\|^4 \right)^{2^j} < \infty.
\]

Moreover, we see that (ii) and (iii) imply
\[
n_k^{-2} \sum_{i=1}^{n_k} EY_{n_k,i}^2 \leq 8n_k^{-2} \sum_{i=1}^{n_k} E\|X_i'\|^2 = o(1)
\]

as
\[
(n_k^{-2} \sum_{i=1}^{n_k} E\|X_i'\|^2)^2 = n_k^{-4} \sum_{i=1}^{n_k} E\|X_i'\|^4 + n_k^{-2} \sum_{m=2}^{m-1} E\|X_m'\|^2 \sum_{i=1}^{n_k} E\|X_i'\|^2
\]

implies
\[
(n_k^{-2} \sum_{i=1}^{n_k} E\|X_i'\|^2)^2 \to 0 \text{ as } k \to \infty.
\]

Now we see that \( \{Y_{n_k,i}, 2 \leq i \leq n\} \) and \( \{Y_{n_k,i}, 1 \leq i \leq n\} \) are martingale differences for fixed \( n \). Therefore
\[ \sum_{k=1}^{\infty} \left( P\left[ \sum_{m=2}^{n_k} \sum_{i=1}^{m-1} Y_{n_k,i} \geq n_k^2 \varepsilon'/2 \right] \right)^{2^j} \leq 2^{2^j+1} (\varepsilon')^{-2^{j+1}} \sum_{k=1}^{\infty} \left\{ \frac{n_k}{m} \sum_{m=2}^{n_k} E\left[ \left( \sum_{i=1}^{m-1} Y_{n_k,i} \right)^2 \right] \right\}^{2^j} \]

\[ \leq 2^{2^j+1} (\varepsilon')^{-2^{j+1}} \sum_{k=1}^{\infty} \left\{ \frac{n_k}{m} \sum_{m=2}^{n_k} E\left[ \left( \sum_{i=1}^{m-1} Y_{n_k,i} \right)^2 \right] \right\}^{2^j} \]

where \( A_j \) is a positive constant depending only on \( j \) and \( \varepsilon \).

Thus we have proved that

\[ \sum_{k=1}^{\infty} \left( P\left[ \left( \sum_{m=2}^{n_k} \sum_{i=1}^{m-1} Y_{n_k,i} \right) \geq n_k^2 \varepsilon'/3 \right] \right)^{2^j} < \infty, \]

which implies that

\[ P\left[ \left( \sum_{m=2}^{n_k} \sum_{i=1}^{m-1} Y_{n_k,i} \right) \geq n_k^2 \varepsilon \right] \rightarrow 0 \text{ as } k \rightarrow \infty. \] (3.2)

Moreover, we state that (3.1) and (i) imply

\[ P\left[ S_{n_k} : n_k \geq n_k \varepsilon \right] = P\left[ S_{n_k} : n_k \geq n_k \varepsilon, S_{n_k} = S_{n_k}' \right] + P\left[ S_{n_k} : n_k \geq n_k \varepsilon, S_{n_k} \neq S_{n_k}' \right] \]

\[ \leq P\left[ S_{n_k} : n_k \geq n_k \varepsilon \right] + \sum_{i=1}^{n_k} P\left[ X_i : n_k \geq n_k \varepsilon \right] \rightarrow 0 \text{ as } k \rightarrow \infty \]

or

\[ P\left[ S_{n_k} : n_k \geq n_k \varepsilon \right] \rightarrow 0 \text{ as } k \rightarrow \infty. \] (3.4)

Hence by (3.3) and (3.4) we get

\[ E\left[ S_{n_k} : n_k \rightarrow 0 \text{ as } k \rightarrow \infty, \right. \]

which together with (3.2) gives

\[ \sum_{k=1}^{\infty} \left( P\left[ S_{n_k} : n_k \geq n_k \varepsilon /3 \right] \right)^{2^j} < \infty. \]

Taking into account that

\[ \sum_{k=1}^{\infty} \left( P\left[ S_{n_k} : n_k \geq n_k \varepsilon /3 \right] \right)^{2^j} \leq 2^{2^j-1} \left\{ \sum_{k=1}^{n_k} \left( \sum_{i=1}^{n_k} P\left[ X_i : n_k \geq n_k \varepsilon /3 \right] \right)^{2^j} + \sum_{k=1}^{\infty} \left( P\left[ S_{n_k} : n_k \geq n_k \varepsilon /3 \right] \right)^{2^j} \} \]

and using (i) we complete the proof of Theorem 1.

COROLLARY 1. Let \( \{ X_n, n \geq 1 \} \) be a sequence of independent, symmetrically distributed,
B-valued random elements. Suppose that \( \{ n_k, k \geq 1 \} \) is a strictly increasing sequence of positive
integers. If for some positive integer \( j \) and any given \( \varepsilon > 0 \)
Now we consider the Hsu and Robbins law of large numbers for subsequences of independent, 
nonsymmetrically distributed random elements taking values in a real separable Banach space.

THEOREM 2. Let \( \{X_n, n \geq 1\} \) be a sequence of independent, \( \mathcal{B} \)-valued random elements. 
Suppose that \( \{n_k, k \geq 1\} \) is a strictly increasing sequence of positive integers. If for some positive 
integer \( j \) and any given \( \varepsilon > 0 \)

\[
(1) \quad \sum_{k=1}^{\infty} \sum_{i=1}^{n_k} P[\|X_i\| \geq n_k \varepsilon / (2 \cdot 3^j)] < \infty,
\]

\[
(II) \quad \sum_{k=1}^{\infty} (n_k^{-4} \sum_{i=1}^{n_k} E[\|X_i\|^4 I[\|X_i\| < 2n_k \varepsilon]) < \infty,
\]

\[
(III) \quad \sum_{k=1}^{\infty} (n_k^{-4} \sum_{m=2}^{n_k} E[\|X_m\|^2 I[\|X_m\| < 2n_k \varepsilon]) \sum_{i=1}^{m-1} E[\|X_i\|^2 I[\|X_i\| < 2n_k \varepsilon]) < \infty,
\]

then

\[
\sum_{k=1}^{\infty} P[\|S_{n_k}\| \geq n_k \varepsilon] < \infty
\]

iff

\[
\|S_{n_k}/n_k\| \to 0 \text{ in probability as } k \to \infty.
\]

PROOF. Assume that \( \{X_n, n \geq 1\} \) is a sequence of symmetrically distributed random 
elements. Then by Theorem 1 we conclude that conditions (I) - (III) are sufficient for the Hsu and 
Robbins law of large numbers, i.e.

\[
\sum_{k=1}^{\infty} P[\|S_{n_k}\| \geq n_k \varepsilon] < \infty
\]

To remove the symmetry assumption we argue as follows. Let \( \{X_n^s, n \geq 1\} \) be a sequence 
of the symmetrized version of \( X \), i.e. \( X_n^s = X_k - X_k^s \), \( k \geq 1 \), where \( X_k \) and \( X_k^s \) are independent and 
have the same distribution. Then by (I) we get for \( \varepsilon' = \varepsilon / 3^j \)

\[
\sum_{k=1}^{\infty} \sum_{i=1}^{n_k} P[\|X_i^s\| \geq n_k \varepsilon'] = \sum_{k=1}^{\infty} \sum_{i=1}^{n_k} P[\|X_i - X_i^s\| \geq n_k \varepsilon']
\]
and by (I) and (II) we have
\[
\sum_{k=1}^{\infty} (n_k^{-4} \sum_{i=1}^{n_k} E[\|X_i\|^4])^{2^j} = \sum_{k=1}^{\infty} (n_k^{-4} \sum_{i=1}^{n_k} E[\|X_i - X_i^*\|^4 I[\|X_i - X_i^*\| < n_k \varepsilon]])^{2^j}
\]
\[
= \sum_{k=1}^{\infty} (n_k^{-4} \sum_{i=1}^{n_k} E[\|X_i - X_i^*\|^4 I[\|X_i - X_i^*\| < n_k \varepsilon]])^{2^j}
\]
\[
+ n_k^{-4} \sum_{i=1}^{n_k} E[\|X_i - X_i^*\|^4 I[\|X_i - X_i^*\| < n_k \varepsilon, \|X_i^*\| \geq n_k \varepsilon])^{2^j}
\]
\[
\leq 2^{2^{j+1}-1} \sum_{k=1}^{\infty} (n_k^{-4} \sum_{i=1}^{n_k} E[\|X_i\|^4 I[\|X_i\| < 2n_k \varepsilon])]^{2^j} + 2^{2^{j}-1} \varepsilon^{2^{j+2}} \sum_{k=1}^{\infty} \sum_{i=1}^{n_k} (P[\|X_i\| \geq n_k \varepsilon])^{2^j} < \infty.
\]

Now we see (II) and (III) imply
\[
n_k^{-2} \sum_{i=1}^{n_k} E[\|X_i\|^2 I[\|X_i\| < 2n_k \varepsilon]] \to 0 \text{ as } k \to \infty \quad \text{(3.5)}
\]

since
\[
(n_k^{-2} \sum_{i=1}^{n_k} E[\|X_i\|^2 I[\|X_i\| < 2n_k \varepsilon]])^{2^j} = n_k^{-4} \sum_{i=1}^{n_k} E[\|X_i\|^4 I[\|X_i\| < 2n_k \varepsilon]]
\]
\[
+ 2n_k^{-4} \sum_{m=2}^{n_k} E[\|X_m\|^2 I[\|X_m\| < 2n_k \varepsilon]] \sum_{i=1}^{m-1} E[\|X_i\|^2 I[\|X_i\| < 2n_k \varepsilon]].
\]

Therefore by (I), (III) and (3.5) we obtain
\[
\sum_{k=1}^{\infty} (n_k^{-4} \sum_{m=2}^{n_k} E[\|X_m^*\|^2] \sum_{i=1}^{m-1} E[\|X_i^*\|^2])^{2^j}
\]
\[
\leq C \left( \sum_{k=1}^{\infty} (n_k^{-4} \sum_{m=2}^{n_k} E[\|X_m\|^2 I[\|X_m\| < 2n_k \varepsilon]] \sum_{i=1}^{m-1} E[\|X_i\|^2 I[\|X_i\| < 2n_k \varepsilon]])^{2^j}
\]
\[
+ \sum_{k=1}^{\infty} (n_k^{-2} \sum_{m=2}^{n_k} E[\|X_m\|^2 I[\|X_m\| < 2n_k \varepsilon]] \sum_{i=1}^{m-1} P[\|X_i\| \geq n_k \varepsilon])^{2^j}
\]
\[
+ \sum_{k=1}^{\infty} (n_k^{-2} \sum_{m=2}^{n_k} P[\|X_m\| \geq n_k \varepsilon] \sum_{i=1}^{m-1} E[\|X_i\|^2 I[\|X_i\| < 2n_k \varepsilon]])^{2^j}
\]
\[
+ \sum_{k=1}^{\infty} \sum_{i=1}^{n_k} P[\|X_i\| \geq n_k \varepsilon] < \infty,
\]

where C is a positive constant depending only on j and \(\varepsilon\).

Hence by Theorem 1 we obtain
\[
\sum_{k=1}^{\infty} P[\|S_{n_k}^*\| \geq n_k \varepsilon] < \infty.
\]

Taking into account the symmetrization inequality (2.3)
\[
P[\|S_{n_k}/n_k - med(S_{n_k}/n_k)\| \geq \varepsilon] \leq 2P[\|S_{n_k}^*\| \geq n_k \varepsilon]
\]
we have
\[ \sum_{k=1}^{\infty} P[\|S_{n_k}/n_k - \text{med}(S_{n_k}/n_k)\| \geq \varepsilon] < \infty. \]
But the assumption \( P[\|S_{n_k}\| \geq n_k \varepsilon] \to 0 \) as \( k \to \infty \)
\[ \|\text{med}(S_{n_k}/n_k)\| \to 0 \] as \( k \to \infty, \]
which together with
\[ \sum_{k=1}^{\infty} P[\|S_{n_k}/n_k - \text{med}(S_{n_k}/n_k)\| \geq \varepsilon] < \infty \]
gives
\[ \sum_{k=1}^{\infty} P[\|S_{n_k}\| \geq n_k \varepsilon] < \infty. \]

**COROLLARY 2.** Let \( \{X_n, n \geq 1\} \) be a sequence of independent, \( B \)-valued random elements. Suppose that \( \{n_k, k \geq 1\} \) is a strictly increasing sequence of positive integers. If for some positive integer \( j \) and any given \( \varepsilon > 0 \)

\( (I') \quad \sum_{k=1}^{\infty} \sum_{i=1}^{n_k} P[\|X_i\| \geq n_k \varepsilon/(2 \cdot 3^j)] < \infty, \]

\( (II') \quad \sum_{k=1}^{\infty} (n_k^{-2} \sum_{i=1}^{n_k} E\|X_i\|^2[I[\|X_i\| < 2n_k \varepsilon])^{2^j} < \infty, \]
then
\[ \sum_{k=1}^{\infty} P[\|S_{n_k}\| \geq n_k \varepsilon] < \infty \]
iff
\[ \|S_{n_k}/n_k\| \to 0 \] in probability as \( k \to \infty. \]

**COROLLARY 3.** Let \( \{X_n, n \geq 1\} \) be a sequence of independent, \( B \)-valued random elements. Suppose that \( \{n_k, k \geq 1\} \) is a strictly increasing sequence of positive integers. If for some positive integer \( j \) and any given \( \varepsilon > 0 \)

\( (I''') \quad \sum_{k=1}^{\infty} \sum_{i=1}^{n_k} P[\|X_i\| \geq n_k \varepsilon/(2 \cdot 3^j)] < \infty, \]

\( (II''') \quad \sum_{k=1}^{\infty} (n_k^{-4} \sum_{i=1}^{n_k} E\|X_i\|^4[I[\|X_i\| < 2n_k \varepsilon])^{2^j} < \infty, \]

\( (III''') \quad \sum_{k=1}^{\infty} (n_k^{-2} \sum_{i=1}^{n_k} E\|X_i\|^2[I[\|X_i\| < 2n_k \varepsilon])^{2^j+1} < \infty, \]
then
\[
\sum_{k=1}^{\infty} P[\|S_{nk}\| \geq n_k \varepsilon] < \infty
\]

iff

\[
\|S_{nk}/n_k\| \rightarrow 0 \text{ in probability as } k \rightarrow \infty.
\]

Some results concerning the independent identically distributed random elements can be obtained as corollaries of Theorem 2.

**COROLLARY 4.** Let \( \{X_n, n \geq 1\} \) be a sequence of independent, identically distributed \( B \)-valued random elements. Suppose that \( \{n_k, k \geq 1\} \) is a strictly increasing sequence of positive integers. If for some positive integer \( j \) and any given \( \varepsilon > 0 \)

\[
(I^*) \quad \sum_{k=1}^{\infty} n_k P[\|X_1\| \geq n_k \varepsilon/(2 \cdot 3^j)] < \infty,
\]

\[
(III^*) \quad \sum_{k=1}^{\infty} (n_k^{-3}E\|X_1\|^4 P[\|X_1\| < 2n_k \varepsilon])^{2^j} < \infty,
\]

\[
(III^*) \quad \sum_{k=1}^{\infty} (n_k^{-1}E\|X_1\|^2 P[\|X_1\| < 2n_k \varepsilon])^{2^{j+1}} < \infty,
\]

then

\[
\sum_{k=1}^{\infty} P[\|S_{nk}\| \geq n_k \varepsilon] < \infty
\]

iff

\[
\|S_{nk}/n_k\| \rightarrow 0 \text{ in probability as } k \rightarrow \infty.
\]

**COROLLARY 5.** (Theorem of Hsu and Robbins for random elements taking values in Banach space) If \( \{X_n, n \geq 1\} \) is a sequence of independent, identically distributed \( B \)-valued random elements with \( EX_1 = 0 \) and \( E\|X_1\|^2 < \infty \), then

\[
\sum_{k=1}^{\infty} P[\|S_{nk}\| \geq n_k \varepsilon] < \infty.
\]

**PROOF.** It is easy to see that conditions \((I^*) \cdot (III^*)\) from Corollary 4 are satisfied by the assumptions \( EX_1 = 0 \) and \( E\|X_1\|^2 < \infty \). Moreover, by the strong law of large numbers for a sequence \( \{X_n, n \geq 1\} \) of independent, identically distributed random elements we conclude that

\[
\|S_n/n\| \rightarrow 0 \text{ in probability as } n \rightarrow \infty.
\]

**COROLLARY 6.** Let \( \{X_n, n \geq 1\} \) be a sequence of independent, identically distributed \( B \)-valued random elements with \( EX_1 = 0 \) and let \( \{n_k, k \geq 1\} \) be a strictly increasing sequence of positive integers. Suppose that for some \( r, 1 < r \leq 2 \),

\[
x^{-r} M(\psi(x)) \rightarrow \infty \text{ as } x \rightarrow \infty,
\] (3.6)
where \( \psi(x) = \text{card}\{k : n_k \leq x\}, \quad x > 0, \quad \psi(0) = 0, \quad M(x) = \sum_{k=1}^{[x]} n_k, \quad x > 0. \)

If

\[
\sum_{k=1}^{\infty} n_k P[\|X_k\| \geq n_k \varepsilon] < \infty \tag{3.7}
\]

then

\[
\sum_{k=1}^{\infty} P[\|S_{n_k}\| \geq n_k \varepsilon] < \infty.
\]

**PROOF.** The assumption (3.7) implies that \( EM(\psi(\|X_k\|)) < \infty \) which with (3.6) gives \( E\|X_k\|^r < \infty \) for some \( r, 1 < r \leq 2. \)

Now it is easy to show that there exists some positive integer \( j \), for which

\[
\sum_{k=1}^{\infty} (n_k^{-3} E\|X_k\|^4 I[\|X_k\| < 2n_k \varepsilon])^{2j} \leq \sum_{k=1}^{\infty} (n_k^{-3} E\|X_k\|^{r}(2n_k \varepsilon)^{4-r})^{2j} \leq C \cdot \sum_{k=1}^{\infty} n_k^{(1-r)2j} (E\|X_k\|^r)^{2j} < \infty.
\]

and

\[
\sum_{k=1}^{\infty} (n_k^{-1} E\|X_k\|^2 I[\|X_k\| < 2n_k \varepsilon])^{2j+1} \leq \sum_{k=1}^{\infty} (n_k^{-1} E\|X_k\|^{r}(2n_k \varepsilon)^{2-r})^{2j+1} \leq C' \sum_{k=1}^{\infty} n_k^{(1-r)2j+1} (E\|X_k\|^{r})^{2j+1} < \infty.
\]

Similarly, as in the proof of Corollary 5, by the strong law of large numbers for a sequence \( \{X_n, n \geq 1\} \) of independent, identically distributed random elements we conclude that

\[\|S_{n_k}/n_k\| \rightarrow 0 \text{ in probability as } k \rightarrow \infty.\]

**REMARK.** Note that the WLLN is implied by the additional conditions: \( EX_n = 0 \) and \( B \) is of the type 2 since

\[
P[\|S_{n_k}\| \geq n_k \varepsilon] \leq P[\|S_{n_k} - ES_{n_k}\| \geq n_k \varepsilon] \leq P[\|S'_{n_k} - ES'_{n_k}\| \geq n_k \varepsilon] + \sum_{i=1}^{n_k} P[\|X_i\| \geq n_k \varepsilon/(2 \cdot 3')] \leq n_k \varepsilon/(2 \cdot 3') = O(1).
\]

Now we are going to present some results on complete convergence for randomly indexed partial sums of independent, non-identically distributed random elements.

**THEOREM 3.** Let \( \{X_n, n \geq 1\} \) be a sequence of independent, \( B \)-valued random elements and \( \{T_n, n \geq 1\} \) be positive integer valued random variables. Let \( \{a_n, n \geq 1\} \) be strictly increasing positive integers and \( \{\beta_n, n \geq 1\} \) be positive constants such that \( a_n \rightarrow \infty \) as \( n \rightarrow \infty, \lim sup_n a_n = \beta < 1 \) and

\[
\sum_{n=1}^{\infty} P[|T_n/a_n - N| \geq \beta_n] < \infty, \tag{3.8}
\]

where \( N \) is a positive random variables such that for some \( A, B, \) where \( \beta < A < B < \infty, \ P[A < N < B] = 1. \)
If for some positive integer \( j \) and for any given \( \varepsilon > 0 \)

\[(a) \quad \sum_{i=1}^{\infty} \sum_{k=1}^{\lfloor a_k (B+\beta_k) \rfloor} P[\|X_i\| \geq a_k \varepsilon (A - \beta)/(2 \cdot 3^j)] < \infty,\]

\[(b) \quad \sum_{k=1}^{\infty} \sum_{i=1}^{\lfloor a_k (B+\beta_k) \rfloor} E\|X_i\|^4 I[\|X_i\| < 2a_k \epsilon (A - \beta)] < \infty,\]

\[(c) \quad \sum_{k=1}^{\infty} \sum_{m=2}^{\lfloor a_k (B+\beta_k) \rfloor} E\|X_m\| I[\|X_m\| < 2a_k \epsilon (A - \beta)] \sum_{i=1}^{m-1} E\|X_i\|^4 I[\|X_i\| < 2a_k \epsilon (A - \beta)]^2 < \infty,\]

then

\[\sum_{k=1}^{\infty} P[\|T_{\kappa}\| > T_k \epsilon] < \infty \quad (3.9)\]

if

\[\|S_{\lfloor a_k (B+\beta_k) \rfloor}/[a_k (B + \beta_k)]\| \to 0 \text{ in probability as } k \to \infty.\]

**PROOF.** Note that,

\[P[\|X_i\| > T_n \epsilon, \ |T_n/a_n - N| < \beta_n] + P[\|T_n/a_n - N\| \geq \beta_n] \leq P[\max_{a_n (A - \beta_n) < \beta_n (B + \beta_n)} \|S_j\| \geq a_n \epsilon (A - \beta)] + P[\|T_n/a_n - N\| \geq \beta_n] \leq 2P[\|X_i\| \geq a_n \epsilon (A - \beta)].\]

By the Lévy’s inequality

\[P[\max_{a_n (A - \beta_n) < \beta_n (B + \beta_n)} \|S_j\| \geq a_n \epsilon (A - \beta)] \leq 2P[\|X_i\| \geq a_n \epsilon (A - \beta)].\]

But under the assumptions of Theorem 3 one can verify after using Theorem 1 with \( n_k = [a_k (B + \beta_k)] \) that

\[\sum_{k=1}^{\infty} P[\|X_i\| \geq a_k \epsilon (A - \beta)] < \infty.\]

This bound and the assumption (3.8) together with (3.10) imply (3.9) for symmetrically distributed random elements.

To remove the symmetry assumption we proceed similar as it has been done in the proof of Theorem 2.

\[\sum_{n=1}^{\infty} P[\|S_{T_n}/T_n - med(S_{T_n}/T_n)\| \geq \epsilon] < \infty. \quad (3.11)\]

Now we note that

\[P[\|\sum_{r=1}^{T_n} X_i\| \geq T_n \epsilon] \]
\[ \begin{align*}
\leq P[ \max_{\|x_n(1+\beta_n)\| < \|x_n(1+\beta_n)\|} \sum_{i=1}^{j} X_i I[\|X_i\| < a_n(A - \beta)\varepsilon]] \geq a_n\varepsilon(A - \beta) ] \\
\sum_{i=1}^{[v_n(A - \beta)]} P[\|X_i\| \geq a_n\varepsilon(A - \beta)] + P[\|T_n/a_n - N\| \geq \beta_n] \\
\end{align*} \]

But by the Kolmogorov’s inequality

\[ \begin{align*}
P[ \max_{\|x_n(1+\beta_n)\| < \|x_n(1+\beta_n)\|} \sum_{i=1}^{j} X_i I[\|X_i\| < a_n(A - \beta)\varepsilon]] \geq a_n\varepsilon(A - \beta) ] \\
\sum_{i=1}^{[v_n(A - \beta)]} E\|X_i\|^2 I[\|X_i\| < a_n\varepsilon(A - \beta)] \leq (\varepsilon(A - \beta))^{-1} a_n^{-1} \sum_{i=1}^{[v_n(A - \beta)]} E\|X_i\|^2 I[\|X_i\| < a_n\varepsilon(A - \beta)].
\end{align*} \]

Taking into account that

\[ a_n^{-2} \sum_{i=1}^{[v_n(A - \beta)]} E\|X_i\|^2 I[\|X_i\| < a_n\varepsilon(A - \beta)] \to 0 \text{ as } n \to \infty \]

(cf. the proof of Theorem 1), (3.8) and assumption (a) we have

\[ P[\| \sum_{i=1}^{T_n} X_i \| \geq T_n\varepsilon] \to 0 \text{ as } n \to \infty. \tag{3.12} \]

Therefore, (3.11) and (3.12) imply that

\[ \|\text{med}(S_{T_n}/T_n)\| \to 0 \text{ as } n \to \infty, \]

and complete the proof of the Theorem 3.

Note that Theorem 3 generalizes the results presented by Adler [15].

The following corollary is an extension of Adler’s result to independent non-identically distributed B-valued random elements.

**COROLLARY 7.** Let \( \{X_n, n \geq 1\} \) be a sequence of independent, B-valued random elements and \( \{T_n, n \geq 1\} \) be positive integer valued random variables. Suppose that \( \{a_n, n \geq 1\} \) is a strictly increasing sequence of positive integers and \( \{\beta_n, n \geq 1\} \) is a sequence of positive constants such that \( a_n \to \infty \) as \( n \to \infty \), \( \limsup_{n \to \infty} \beta_n = \beta < 1 \) and

\[ \sum_{n=1}^{\infty} P[\|T_n/a_n - 1\| \geq \beta_n] < \infty. \]

If for some positive integer \( j \) and for any given \( \varepsilon > 0 \) the assumptions (a)-(c) are satisfied then

\[ \sum_{k=1}^{\infty} P[\|S_{T_k}\| \geq T_k\varepsilon] < \infty \]

if

\[ \|S_{[a_k(1+\beta_k)]}/[a_k(1+\beta_k)][\| \to 0 \text{ in probability as } k \to \infty. \]

The next corollary is an extension of one of the results given in Adler [15] to the case of i.i.d. B-valued random elements.
COROLLARY 8. Let \( \{X_n, n \geq 1\} \) be a sequence of independent identically distributed \( B \)-valued random elements with \( EX_1 = 0 \) and \( \{T_n, n \geq 1\} \) be a sequence of positive integer-valued random variables. Suppose that \( \{a_n, n \geq 1\} \) is a strictly increasing sequence of positive integers and \( \{\beta_n, n \geq 1\} \) is a sequence of positive constants such that \( a_n \to \infty \) as \( n \to \infty \), \( \lim \sup_{n \to \infty} \beta_n = \beta < 1 \) and
\[
\sum_{n=1}^{\infty} P[|T_n/a_n - 1| \geq \beta_n] < \infty.
\]
Suppose that for some \( r, 1 < r \leq 2, x^{-r}M(\psi(x)) \to \infty \) as \( x \to \infty \), where \( \psi(x) = \text{card}\{k : a_k \leq x\} \), \( x > 0 \), \( \psi(0) = 0 \), \( M(x) = \sum_{k=1}^{[x]} a_k \), \( x > 0 \).
\[
\text{If } \sum_{k=1}^{\infty} a_k P[\|X_k\| \geq a_k \varepsilon] < \infty \text{ then }
\sum_{k=1}^{\infty} P[\|S_{T_k}\| \geq T_k \varepsilon] < \infty.
\]

ACKNOWLEDGEMENT. We are very grateful to the referee for his helpful comments allowing us to improve the previous version of the paper.

REFERENCES
Special Issue on
Boundary Value Problems on Time Scales

Call for Papers

The study of dynamic equations on a time scale goes back to its founder Stefan Hilger (1988), and is a new area of still fairly theoretical exploration in mathematics. Motivating the subject is the notion that dynamic equations on time scales can build bridges between continuous and discrete mathematics; moreover, it often reveals the reasons for the discrepancies between two theories.

In recent years, the study of dynamic equations has led to several important applications, for example, in the study of insect population models, neural network, heat transfer, and epidemic models. This special issue will contain new researches and survey articles on Boundary Value Problems on Time Scales. In particular, it will focus on the following topics:

- Existence, uniqueness, and multiplicity of solutions
- Comparison principles
- Variational methods
- Mathematical models
- Biological and medical applications
- Numerical and simulation applications

Before submission authors should carefully read over the journal's Author Guidelines, which are located at http://www.hindawi.com/journals/ade/guidelines.html. Authors should follow the Advances in Difference Equations manuscript format described at the journal site http://www.hindawi.com/journals/ade/. Articles published in this Special Issue shall be subject to a reduced Article Processing Charge of €200 per article. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
