AN $L^p - L^q$ VERSION OF HARDY'S THEOREM FOR SPHERICAL FOURIER TRANSFORM ON SEMISIMPLE LIE GROUPS

S. BEN FARAH, K. MOKNI, and K. TRIMÈCHE

Received 17 September 2002

We consider a real semisimple Lie group $G$ with finite center and $K$ a maximal compact subgroup of $G$. We prove an $L^p - L^q$ version of Hardy's theorem for the spherical Fourier transform on $G$. More precisely, let $a$, $b$ be positive real numbers, $1 \leq p, q \leq \infty$, and $f$ a $K$-bi-invariant measurable function on $G$ such that $h_a^{-1} f \in L^p(G)$ and $e^{b \| \lambda \|^2} \hat{f}(\lambda) \in L^q(\mathfrak{a}^*)$ ($h_a$ is the heat kernel on $G$). We establish that if $ab \geq 1/4$ and $p$ or $q$ is finite, then $f = 0$ almost everywhere. If $ab < 1/4$, we prove that for all $p$, $q$, there are infinitely many nonzero functions $f$ and if $ab = 1/4$ with $p = q = \infty$, we have $f = \text{const} h_a$.

2000 Mathematics Subject Classification: 22E30, 22E46, 43A30.

1. Introduction. In the usual Fourier analysis on $\mathbb{R}$, it is known, by a theorem of L. Schwartz, that a function $f$ on $\mathbb{R}$ is rapidly decreasing if and only if its Fourier transform $\hat{f}$ is rapidly decreasing. A theorem of Hardy [8] measures this rapidity in the following meaning: for given positive real numbers $a$ and $b$, suppose that $f$ is a measurable function such that $|f(x)| \leq \text{const} e^{-ax^2}$ and $|\hat{f}(y)| \leq \text{const} e^{-by^2}$. Then $f = 0$ almost everywhere if $ab > 1/4$, $f(x) = \text{const} e^{-ax^2}$ if $ab = 1/4$, and there are infinitely many nonzero functions $f$ if $ab < 1/4$.

This theorem has been generalized in other situations as the Heisenberg group [3] and the Euclidean motion group [15]. In particular, for a semisimple Lie group $G$, Sitaram and Sundari proved in [14] a version of Hardy’s theorem when $G$ has one conjugacy class of Cartan subgroups. Their result has been extended to all semisimple Lie groups by Cowling et al. in [5], Ebata et al. in [6], and Sengupta in [12].

Another generalization is the $L^p - L^q$ version of Hardy’s theorem, proved by Cowling and Price in [4]. More precisely, taking $1 \leq p, q \leq \infty$ (with $p$ or $q$ finite) and supposing that for a measurable function $f$, $e^{ax^2} f(x) \in L^p(\mathbb{R})$, $e^{by^2} \hat{f}(y) \in L^q(\mathbb{R})$, and $ab \geq 1/4$, then $f = 0$ almost everywhere. An analogue of this result has been also proved for the motion group in [7].

In this paper, we consider a real semisimple Lie group $G$ with finite center, $G = K \exp(\mathfrak{a}^*) K$ a Cartan decomposition of $G$, and $h_a$ the heat kernel on $G$. We establish the following $L^p - L^q$ version of Hardy’s theorem for the spherical Fourier transform on $G$.

Let $a$, $b$ be positive real numbers, $1 \leq p, q \leq \infty$, and $f$ a $K$-bi-invariant measurable function such that $h_a^{-1} f \in L^p(G)$ and $e^{b \| \lambda \|^2} \hat{f}(\lambda) \in L^q(\mathfrak{a}^*)$.

If $p$ or $q$ is finite and $ab \geq 1/4$, then $f = 0$ almost everywhere.
In case $p = q = \infty$,
(i) if $ab > 1/4$, then $f = 0$ almost everywhere,
(ii) if $ab = 1/4$, then $f = \text{const} h_a$.
If $ab < 1/4$, we prove that for all $p$, $q$, there are infinitely many nonzero functions satisfying the $L^p - L^q$ conditions.

This theorem is exactly the analogue of the result of Cowling and Price in [4]. We believe that comparing $f$ to the heat kernel and $\mathcal{F}(f)$ to $e^{-b||\lambda||^2}$ is the natural way to generalize Hardy’s theorem on $G$, because in the Euclidian case of $\mathbb{R}$, the function $e^{-ax^2}$ is also the heat kernel.

In [11] and in order to give an $L^p$ version of Hardy’s theorem on $G$, Narayanan and Ray remark that if they compare $f$ to $e^{-a||x||^2}$ and $\hat{f}$ to $e^{-b||\lambda||^2}$, they only obtain the result for $p \geq 2$. Then they take the function $e^{-a||x||^2} |\varphi_0|^{1-2/p}$ instead of $e^{-a||x||^2}$ to get the result for all $1 \leq p \leq \infty$, but this condition depends on $p$. ($\varphi_0$ is the spherical function defined in Section 2.2.)

To prove our result, we adapt the classical methods as in [4, 6, 14]. We use the fact that $h_a^{-1} f \in L^p(G)$ to give an estimation of $\mathcal{F}(f)$ (Lemma 4.2), then we add the hypothesis $e^{b||\lambda||^2} \mathcal{F}(f) \in L^q(\mathfrak{a}^*_+)$ to conclude with a Phragmén-Lindelöf-type theorem.

This paper is organized as follows. In Section 2, we introduce some notations and results for semisimple Lie groups and spherical Fourier transform. In Section 3, we prove different versions of the Phragmén-Lindelöf theorems, which are crucial for the proof of the principal results of the paper. We give the $L^p - L^q$ version of Hardy’s theorem in Section 4.

2. Preliminaries. In this section, we introduce some classical notations and results about semisimple Lie groups and spherical functions. For details, we refer to [10, 16].

2.1. Notations. Let $G$ be a connected, noncompact real semisimple Lie group with finite center, and $K$ a fixed maximal compact subgroup of $G$. Let $\mathfrak{g}$ and $\mathfrak{k}$ be the Lie algebras of $G$ and $K$, respectively. Take $\mathfrak{g} = \mathfrak{k} + \mathfrak{p}$ a Cartan decomposition of $\mathfrak{g}$ and $\mathfrak{a}$ a maximal commutative subspace of $\mathfrak{p}$. Denote by $\mathfrak{a}^*$ the real dual of $\mathfrak{a}$ and $\mathfrak{a}_c^*$ its complexification. The associated Killing form defines a scalar product $\langle \cdot, \cdot \rangle$ on $\mathfrak{a}$.

For $\lambda \in \mathfrak{a}^*$, let $H_\lambda$ be the unique element in $\mathfrak{a}$ such that $\lambda(H) = \langle H_\lambda, H \rangle$ for all $H \in \mathfrak{a}$. If $\lambda, \mu \in \mathfrak{a}^*$, then $\langle \lambda, \mu \rangle = \langle H_\lambda, H_\mu \rangle$ defines a scalar product on $\mathfrak{a}^*$ which can be extended to $\mathfrak{a}_c^*$ as a Hermitian product, denoted also by $\langle \cdot, \cdot \rangle$. Let $\| \cdot \|$ be the associated norm.

For $\lambda \in \mathfrak{a}^*$, put $g_\lambda = \{ X \in \mathfrak{g} \mid [H, X] = \lambda(H)X; \text{ for all } H \in \mathfrak{a} \}$. If $\lambda \neq 0$ and $g_\lambda \neq \{0\}$, then $\lambda$ is called a (restricted) root. Let $m_\lambda = \dim g_\lambda$.

As usual, denote by $\Sigma$ the set of all roots. Let $\Sigma^+$ be a fixed set of positive roots, $\Sigma^+_0$ the set of positive indivisible roots, $\overline{\alpha}_+$, $\overline{\alpha}_c^+$ the corresponding Weyl chambers, respectively, in $\mathfrak{a}$ and $\mathfrak{a}^*$. Denote by $\overline{\alpha}^+_+$, $\overline{\alpha}_c^+_+$ their usual closures. Let $W$ be the Weyl group for $\Sigma$.

Choose $\beta_1, \ldots, \beta_l$ a basis of $\mathfrak{a}^*$ constituted by simple roots in $\Sigma^+$. Take $\mu_1, \ldots, \mu_l$ in $\mathfrak{a}^*$ such that for $1 \leq i, j \leq l$, $\langle \mu_i, \beta_j \rangle = \delta_{ij}$. Then $\mu_1, \ldots, \mu_l$ is a basis of $\mathfrak{a}^*$ and $\mathfrak{a}_c^+ = \sum_{i=1}^l \mathbb{R}_{\geq 0} \cdot \mu_i$.

We have the Cartan decomposition $G = K \exp(\overline{\alpha}_c^+) K$. For all $x \in G$, denote $|x| = \|x^+\|$, where $x^+$ is the $\mathfrak{a}_c$ component of $x$ in the above decomposition.
One has also the usual Iwasawa decomposition $G = K \exp(a) N$. For all $x \in G$, let $H(x)$ be the unique element in $a$ such that $x \in K \exp H(x) N$.

We normalize the Lebesgue measures $dH$ and $d\lambda$, respectively, on $a$ and $a^*$ such that the Fourier transform,

$$\mathcal{F}_0(f)(\lambda) = \int_a f(H) e^{-i\lambda(H)} dH,$$

has the inversion formula

$$\mathcal{F}_0^{-1}(g)(H) = \int_{a^*} g(\lambda) e^{i\lambda(H)} d\lambda$$

defined for $g \in \mathcal{S}(a^*)$ (the Schwartz space on $a^*$).

2.2. Spherical functions. The spherical functions on $G$ are defined by

$$\varphi_\lambda(x) = \int_K e^{(i\lambda - \rho)(H(xk))} dk, \quad x \in G, \lambda \in a^+_\mathbb{C},$$

where $dk$ is the Haar measure on $K$ of total measure 1 and $\rho = (1/2) \sum_{\alpha \in \Sigma^+} m_\alpha \alpha$.

These functions satisfy the following properties:

(i) for $\lambda \in a^+_\mathbb{C}$, the function $x \mapsto \varphi_\lambda(x)$ is $\mathcal{C}^\infty$ and $K$-bi-invariant,

(ii) for $x \in G$, the function $\lambda \mapsto \varphi_\lambda(x)$ is analytic and $W$-invariant on $a^+_\mathbb{C}$,

(iii) $|\varphi_\lambda(x)| \leq \varphi_{i\lambda}(x) \quad \lambda \in a^+_\mathbb{C},$

(iv) $|\varphi_{i\lambda}(\exp H)| \leq e^{\lambda(H)} \varphi_0(\exp H) \quad \lambda \in a^+_\mathbb{C}, \quad H \in a^+,$

(v) $e^{-\rho(H)} \leq \varphi_0(\exp H) \leq \text{const} \left(1 + \|H\|^d\right) e^{-\rho(H)}, \quad H \in a^+,$

for some constant $d > 0$.

2.3. The Harish-Chandra $c$-function. The Harish-Chandra $c$-function is given by the formula

$$c(\lambda) = c_0 \prod_{\alpha \in \Sigma^+_0} \frac{\Gamma((1/2) \langle i\lambda, \alpha_0 \rangle) \Gamma((1/2) \langle i\lambda, \alpha_0 \rangle + 1/2)}{2\sqrt{\pi} \Gamma((1/4) m_\alpha + 1/2 + (1/2) \langle i\lambda, \alpha_0 \rangle) \Gamma((1/4) m_\alpha + (1/2) m_{2\alpha} + (1/2) \langle i\lambda, \alpha_0 \rangle)},$$

(2.7)

where $\alpha_0 = \alpha/\langle \alpha, \alpha \rangle$, the constant $c_0$ is defined by $c(i\rho) = 1$, and $\Gamma$ is the usual gamma function.

The $c$-function satisfies the following result.

**Lemma 2.1.** Let $\lambda \in a^+_\mathbb{C}$ and $r > 0$. Then

$$|c(r\lambda)|^{-2} \leq \max \left(r^{\dim N}, 1 \right) |c(\lambda)|^{-2}.$$

(2.8)
Moreover, there are positive constants $D$ and $\sigma_0$ such that for all $x \geq \sigma_0$,

$$|c(x\lambda)|^{-2} \geq Dx^{\dim N}. \quad (2.9)$$

**Proof.** Inequality (2.8) is an immediate deduction from [16, Proposition IV, page 248].

The proof of (2.9) is based on the fact that $|c(x\lambda)|^{-2}$ is a product of terms of the form $\Gamma(a+i\gamma)/\Gamma(b+i\gamma)$ with $a \geq b \geq 0$ and $\gamma \in \mathbb{R}$, and the fact that

$$\lim_{|\gamma| \to \infty} \frac{\Gamma(a+i\gamma)}{\Gamma(b+i\gamma)}|\gamma|^{b-a} = 1. \quad (2.10)$$

This implies that

$$\lim_{x \to \infty} |c(x\lambda)|^{-2}x^{-\dim N} = c_0^{-1} \left(2^{2\text{card } \Sigma^+_0 - \dim N} \pi^{\text{card } \Sigma^+_0} \right) \prod_{\alpha \in \Sigma^+_0} \langle \lambda, \alpha \rangle^{m_\alpha + m_2\alpha}. \quad (2.11)$$

Since this limit is positive, then there are $\sigma_0 > 0$ and $D > 0$ such that for all $x \geq \sigma_0$, we have inequality (2.9). \qed

2.4. Spherical Fourier transform. We present the following notions:

(i) $\mathcal{D}(G)$ is the space of $\mathcal{C}^\infty$ functions on $G$ with compact support,

(ii) $\mathcal{D}^1(K)$ is the space of $K$-bi-invariant elements of $\mathcal{D}(G)$,

(iii) $L^p(G)$, $1 \leq p < \infty$, are the spaces of measurable functions $f$ on $G$ such that

$$\|f\|_p = \left(\int_G |f(x)|^p \, dx\right)^{1/p} < \infty, \quad (2.12)$$

(iv) $L^\infty(G)$ is the space of measurable functions $f$ on $G$ such that

$$\|f\|_\infty = \text{ess sup}_{x \in G} |f(x)| < \infty, \quad (2.13)$$

(v) $L^q(\mathfrak{a}^*_+, |c(\lambda)|^{-2}d\lambda)$, $1 \leq q < \infty$, are the spaces of measurable functions $g$ on $\mathfrak{a}^*_+$ such that

$$\|g\|_{L^q(\mathfrak{a}^*_+, |c(\lambda)|^{-2}d\lambda)} = \left(\int_{\mathfrak{a}^*_+} |g(\lambda)|^q \, |c(\lambda)|^{-2}d\lambda\right)^{1/q} < \infty, \quad (2.14)$$

(vi) $L^\infty(\mathfrak{a}^*_+, |c(\lambda)|^{-2}d\lambda)$ is the space of measurable functions $g$ on $\mathfrak{a}^*_+$ such that

$$\|g\|_\infty = \text{ess sup}_{\lambda \in \mathfrak{a}^*_+} |g(\lambda)| < \infty. \quad (2.15)$$

In the Cartan decomposition, the Haar measure on $G$ is given by the formula

$$\int_G f(x) \, dx = \int_K \int_{\mathfrak{a}^+} \int_{\mathfrak{h}} f(k_1(\exp H)k_2) \delta(H) \, dk_1 \, dH \, dk_2, \quad (2.16)$$

where $\delta(H) = \prod_{\alpha \in \Sigma^+} [2 \sinh \alpha(H)]^{m_\alpha}$ and $f \in \mathcal{D}(G)$. Note that

$$0 \leq \delta(H) \leq e^{2\rho(H)}. \quad (2.17)$$
Let $1 \leq p < \infty$ and let $f \in L^p(G)$ be a $K$-bi-invariant function; then
\[
\int_G |f(x)|^p \, dx = \int_{\mathbb{R}_+} |f(\exp H)|^p \delta(H) \, dH.
\] (2.18)

The spherical Fourier transform on $G$ is defined by
\[
\mathcal{F}(f)(\lambda) = \int_G f(x) \varphi_{-\lambda}(x) \, dx, \quad f \in L^1(G).
\] (2.19)

The inversion formula is given by
\[
\mathcal{F}^{-1}(h)(x) = \int_{\mathbb{R}_+} h(\lambda) \varphi_{\lambda}(x) \left| c(\lambda) \right|^{-2} \, d\lambda, \quad h = \mathcal{F}(f).
\] (2.20)

We remark that the transform $\mathcal{F}$ is injective on the space of $K$-bi-invariant functions of $L^1(G)$.

### 2.5. The heat kernel.

The heat kernel $h_a(x)$ is defined for $x \in G$ and $a > 0$ by
\[
h_a(x) = \int_{\mathbb{R}_+} e^{-(1/4a)(\|\lambda\|^2 + \|\rho\|^2)} \varphi_{\lambda}(x) \left| c(\lambda) \right|^{-2} \, d\lambda,
\] (2.21)

where $h_a$ is a positive $K$-bi-invariant $C^\infty$ function on $G$. Its spherical Fourier transform is defined for $\lambda \in \mathfrak{a}^*$ by
\[
\mathcal{F}(h_a)(\lambda) = e^{-(1/4a)(\|\lambda\|^2 + \|\rho\|^2)}.
\] (2.22)

Moreover, $\mathcal{F}(h_a)$ is analytic on $\mathfrak{a}^*_C$ and defined for $\lambda \in \mathfrak{a}^*_C$ by
\[
\mathcal{F}(h_a)(\lambda) = e^{-(1/4a)((\lambda,\lambda) + \|\rho\|^2)}.
\] (2.23)

Anker [1] has proved the following estimate of the heat kernel:
\[
h_a(\exp(H)) \leq C(1 + \|H\|^2)^{d'} e^{-a\|H\|^2} e^{-(\rho,H)},
\] (2.24)

where $d' = (\dim(G/K) - \dim(\mathfrak{a})) / 2$ and $C$ is a positive constant depending on $a$.

In the particular cases when $G/K$ is of rank one or $G = \text{SL}(3,\mathbb{R})$, we also have
\[
h_a(\exp(H)) \geq D(1 + \|H\|^2)^{d'} e^{-a\|H\|^2} e^{-(\rho,H)},
\] (2.25)

where $D$ is a positive constant depending on $a$.

Note that Anker has conjectured this inequality for all noncompact symmetric spaces. (See [2] for details and references.)

### 3. Phragmén-Lindelöf-type results.

The proofs of the main results of this paper depend on the following complex analysis results.

Let $Q_\theta$ denote the sector in $\mathbb{C}$ defined by $Q_\theta = \{re^{i\psi} : r > 0, \psi \in ]0,\theta[\}$ and $Q = Q_{\pi/2} = \mathbb{R}_+^* + i\mathbb{R}_+^*$. Denote by $\overline{Q_\theta}$ the usual closure of $Q_\theta$. 
Fix \( \gamma \) a positive measurable function on \( [0, \infty) \) verifying the following:

(i) there are an integer \( k > 0 \) and a real \( \sigma_0 > 0 \) such that

\[
\forall r > 0, \forall x \geq \sigma_0, \quad \gamma(rx) \leq \text{const max}(r^k, 1)\gamma(x),
\]  

(3.1)

(ii) there is \( \varepsilon_0 > 0 \) such that

\[
\forall \sigma > \sigma_0, \quad d_\gamma(\sigma) = \int_\sigma^{\sigma+1} \gamma(x)dx \geq \varepsilon_0.
\]  

(3.2)

**Lemma 3.1.** Let \( g \) be an analytic function on \( Q \) continuous on \( \overline{Q} \). Suppose that for \( q \in [1, \infty[ \) and a constant \( M > 0 \),

\[
|g(z)| \leq Me^{\pi R(z^2)}, \quad z \in \overline{Q},
\]

\[
\int_0^\infty |g(x)|^q \gamma(x)dx \leq M.
\]  

(3.3)

Then

\[
\int_\sigma^{\sigma+1} |g(xe^{i\psi})| \gamma(x)dx \leq \text{const} d_\gamma(\sigma)\sigma^k
\]  

(3.4)

for all \( \psi \in [0, \pi/2] \) and sufficiently large \( \sigma \in \mathbb{R}_+ \).

**Proof.** The proof uses the same arguments of Cowling and Price in [4]. Let \( \theta \in ]0, \pi/2[ \) and \( \varepsilon \in ]0, \pi/2 - \theta[ \). Define the function \( g \) on \( \overline{Q_\theta} \) by

\[
g_\varepsilon(z) = g(z) \exp \left[ i\varepsilon ei\varepsilon \pi \left( \frac{\pi - 2\varepsilon}{\theta} \right) + \frac{i\pi}{2} \cdot \cot(\theta) \cdot z^2 \right].
\]  

(3.5)

The function \( g_\varepsilon(re^{i\psi}) \) is bounded on \( \overline{Q_\theta} \) and tends to 0 as \( r \to +\infty \) uniformly in \( \psi \in [0, \theta] \). Fix \( \sigma \geq \sigma_0 \) and take \( S \) a measurable function on \( [\sigma, \sigma + 1] \) of \( L^\infty \)-norm 1. Define \( F \) on \( \overline{Q_\theta} \) by

\[
F(re^{i\psi}) = \int_\sigma^{\sigma+1} S(x) g_\varepsilon(rx e^{i\psi}) \gamma(x)dx,
\]  

(3.6)

then \( F \) is analytic on \( Q_\theta \), continuous on \( \overline{Q_\theta} \), and tends to 0 as \( r \to +\infty \) uniformly in \( \psi \in [0, \theta] \). By the maximum principle, we have

\[
\sup_{r > 0, \theta \varepsilon \psi < \theta} |F(re^{i\psi})| \leq \max \left( \sup_{r > 0} |F(re^{i\theta})|, \sup_{r > 0} |F(r)| \right).
\]  

(3.7)

Remark that for \( r > 0 \), we have \( |g_\varepsilon(re^{i\theta})| \leq M \); so

\[
|F(re^{i\theta})| \leq Md_\gamma(\sigma),
\]  

(3.8)

and then

\[
\sup_{r > 0} |F(re^{i\theta})| \leq Md_\gamma(\sigma).
\]  

(3.9)
We now estimate \( \sup_{r>0} |F(r)| \).

(i) For \( r \in [0, 1/(\sigma + 1)] \), we have

\[
|F(r)| \leq \int_{\sigma}^{\sigma + 1} |g_\varepsilon(rx)| y(x) dx \leq M e^{\pi d_\gamma(\sigma)}. \tag{3.10}
\]

(ii) For \( r \in [1/(\sigma + 1), +\infty[ \), we have

\[
|F(r)| \leq \int_{\sigma}^{\sigma + 1} |g_\varepsilon(rx)| y(x) dx, \tag{3.11}
\]

so, by Hölder’s inequality, we obtain

\[
|F(r)| \leq (d_\gamma(\sigma))^{1 - 1/q} \left( \int_{\sigma}^{\sigma + 1} |g_\varepsilon(rx)|^q y(x) dx \right)^{1/q}, \tag{3.12}
\]

and, by the change of variable \( t = rx \), we obtain

\[
|F(r)| \leq (d_\gamma(\sigma))^{1 - 1/q} \sigma^{1/q} \left( \int_0^\infty |g_\varepsilon(t)|^q y\left(\frac{t}{r}\right) dt \right)^{1/q}. \tag{3.13}
\]

Using the estimates (3.1) and (3.2) of \( \gamma \), we get

\[
|F(r)| \leq \text{const} d_\gamma(\sigma) \sigma^k. \tag{3.14}
\]

Finally, we deduce that for sufficiently large \( \sigma \) and for all \( r > 0, \theta \in [0, \pi/2[ \),

\[
|F(r)| \leq \text{const} d_\gamma(\sigma) \sigma^k, \quad |F(re^{i\theta})| \leq \text{const} d_\gamma(\sigma) \sigma^k. \tag{3.15}
\]

Letting first \( \varepsilon \) tend to 0, \( \theta \) tend to \( \pi/2 \), and taking the supremum over all \( S \), we obtain (3.4) for all \( \psi \in [0, \pi/2] \). \( \square \)

**Lemma 3.2.** Let \( f \) be an analytic even function on \( \mathbb{C} \). Suppose that for \( 1 \leq q < +\infty \) and a constant \( \nu > 0 \),

\[
|f(z)| \leq \text{const} e^{\nu \Re(z^2)}, \quad z \in \mathbb{C},
\]

\[
\int_0^\infty |f(x)|^q y(x) dx < \infty. \tag{3.16}
\]

Then \( f = 0 \) on \( \mathbb{C} \).

**Proof.** By the change of variable \( z \rightarrow \sqrt{\pi/\nu} \cdot z \), we may assume that \( \nu = \pi \). If we apply Lemma 3.1 to the functions \( z \rightarrow f(z) \) and \( z \rightarrow \overline{f(z)} \) and use the fact that \( f \) is even, then, for large \( \sigma > 0 \) and for all \( \psi \in \mathbb{R} \), we have

\[
\int_{\sigma}^{\sigma + 1} |f(xe^{i\psi})| y(x) dx \leq \text{const} d_\gamma(\sigma) \sigma^k. \tag{3.17}
\]
On the other hand, Cauchy’s integral formula gives

\[ |f^{(n)}(0)| \leq \frac{n!}{2\pi} \int_0^{2\pi} |f(xe^{i\psi})| x^{-n} d\psi \]  

(3.18)

for all \( x > 0 \) and \( n \in \mathbb{N} \). Integrating this inequality between a large \( \sigma \) and \( \sigma + 1 \), we get

\[ d_\gamma(\sigma) |f^{(n)}(0)| \leq \frac{n!}{2\pi} \int_\sigma^{\sigma+1} \int_0^{2\pi} |f(xe^{i\psi})| x^{-n} y(x) d\psi dx, \]  

(3.19)

and by Lemma 3.1, we obtain

\[ |f^{(n)}(0)| \leq \text{const} \sigma^{k-n}, \]  

(3.20)

which implies that \( f \) is a polynomial function, the integrability condition of the hypothesis gives that \( f = 0 \) on \( \mathbb{C} \).

We also need the following Phragmén-Lindelöf theorem [9].

**Theorem 3.3.** Suppose that \( F \) is an entire function on \( \mathbb{C} \), where \( a, C \) are positive numbers. If

\[ |F(\zeta)| \leq Ce^{a|\zeta|} \quad (\zeta \in \mathbb{C}), \quad |F(x)| \leq Ce^{-a|x|} \quad (x > 0), \]  

(3.21)

then there is a number \( C' \) such that \( |F(\zeta)| = C'e^{-a\zeta} \).

As a corollary, we have the following lemma.

**Lemma 3.4.** Let \( f \) be an analytic even function on \( \mathbb{C} \). Suppose that for a constant \( \nu > 0 \),

\[ |f(z)| \leq \text{const} e^{\nu|z|^2}, \quad z \in \mathbb{C}, \]

\[ |f(x)| \leq \text{const} e^{-\nu x^2}, \quad x \in \mathbb{R}. \]  

(3.22)

Then \( f = \text{const} e^{-\nu z^2} \) on \( \mathbb{C} \).

**Proof.** The function \( f \) is even and analytic on \( \mathbb{C} \); then there is an entire function \( F \) on \( \mathbb{C} \) such that \( f(z) = F(z^2) \). Applying Theorem 3.3 to \( F \), we obtain the result.

We conclude this section by the following lemma.

**Lemma 3.5.** Let \( f \) be an analytic function on \( \mathbb{C}^l \). Suppose that for all \( t_2 > 0, \ldots, t_l > 0 \), the function \( z \mapsto f(z, t_2 z, \ldots, t_l z) \) is null on \( \mathbb{C} \). Then \( f = 0 \) on \( \mathbb{C}^l \).

**Proof.** Fix \( z \in \mathbb{C}^* \) and \( t_3 > 0, \ldots, t_l > 0 \). Note that the analytic function on \( \mathbb{C} \) defined by \( \zeta \mapsto f(z, \zeta, t_3 z, \ldots, t_l z) \) vanishes on the half-axis \( \mathbb{R}_+ \cdot z \), and then it is null on \( \mathbb{C} \).

So, for all \( t_3 > 0, \ldots, t_l > 0 \), the function \( (z_1, z_2) \mapsto f(z_1, z_2, t_3 z_1, \ldots, t_l z_1) \) is identically null on \( \mathbb{C}^2 \). By induction, we can conclude that \( f = 0 \) on \( \mathbb{C}^l \).
4. The $L^p - L^q$ version of Hardy’s theorem. We begin this section by the following remark.

**Remark 4.1.** Let $1 \leq p \leq \infty$ and let $f$ be a $K$-bi-invariant measurable function on $G$ such that $h_{a^{-1}}f$ is in $L^p(G)$. Then the property (2.5) of the spherical functions and the estimate (2.24) of the heat kernel imply that

$$\mathcal{F}(f)(\lambda) = \int_{a^+} f(\exp H) \varphi_{-\lambda}(\exp H) \delta(H) dH$$

is well defined, $W$-invariant, and analytic on $a^*$.

Moreover, we have the following lemma.

**Lemma 4.2.** Let $1 \leq p \leq \infty$ and let $f$ be a $K$-bi-invariant measurable function on $G$ such that $h_{a^{-1}}f$ is in $L^p(G)$. Then

$$|\mathcal{F}(f)(\lambda)| \leq \text{const} e^{(1/4a) \|\eta\|^2}$$

for all $\xi, \eta \in a^*$ and $\lambda = \xi + i\eta$.

**Proof.** Since inequality (4.2) is invariant under the Weyl group which acts transitively on the set of Weyl chambers, it is sufficient to establish it for $\eta$ in $a^*_+$. Let $\xi, \eta \in a^*_+$ and $\lambda = \xi + i\eta$.

By the property (2.4) such that $|\varphi_{-\lambda}(x)| \leq \varphi_{-i\eta}(x)$, we get

$$|\mathcal{F}(f)(\lambda)| \leq \int_{a^+} |f(\exp H)| \varphi_{-i\eta}(\exp H) \delta(H) dH.$$ 

(4.3)

Now, to prove (4.2), we distinguish three cases.

**First case** ($1 < p < \infty$). Let $p'$ be such that $1/p + 1/p' = 1$. Since $h_{a^{-1}}f$ is in $L^p(G)$, let $M = \|h_{a^{-1}}f\|_p$. We have, by Hölder’s inequality,

$$|\mathcal{F}(f)(\lambda)| \leq M \left( \int_{a^+} h_{a^{-1}}^{p'}(\exp H) [\varphi_{-i\eta}]^{p'}(\exp H) \delta(H) dH \right)^{1/p'}.$$ 

(4.4)

By inequalities (2.5), (2.6), (2.17), and (2.24), we deduce that

$$h_{a^{-1}}^{p'}(\exp H) [\varphi_{-i\eta}]^{p'}(\exp H) \delta(H) \leq \text{const} P(\|H\|)^{p'} e^{2(1-p')\langle H, H \rangle} e^{-p'(a\|H\|^2 - \langle H, H \rangle)},$$

(4.5)

where $P(\|H\|) = (1 + \|H\|^d)(1 + \|H\|^2)^d$. Note that $P(\|H\|)^{p'} e^{2(1-p')\langle H, H \rangle}$ is bounded on $a^*$; so

$$|\mathcal{F}(f)(\lambda)| \leq \text{const} \left( \int_{a^+} e^{-p'(a\|H\|^2 - \langle H, H \rangle)} dH \right)^{1/p'}.$$ 

(4.6)

Since

$$a\|H\|^2 - \langle H, H \rangle = \frac{1}{a} \left\| aH - \frac{1}{2} H \eta \right\|^2 - \frac{1}{4a} \|\eta\|^2,$$

(4.7)
we get
\[ |\mathcal{F}(f)(\lambda)| \leq \text{const } e^{(1/4a)\|\eta\|^2} \left( \int_{\mathbb{R}^+} e^{-(p'/a)\|a^{-1}H-(1/2)\eta\|^2} dH \right)^{1/p'}. \quad (4.8) \]

If we use the fact that
\[ \int_{\mathbb{R}^+} e^{-(p'/a)\|a^{-1}H-(1/2)\eta\|^2} dH \leq \int_{\mathbb{R}^+} e^{-p'a\|H\|^2} dH, \quad (4.9) \]
we obtain
\[ |\mathcal{F}(f)(\lambda)| \leq \text{const } e^{(1/4a)\|\eta\|^2}. \quad (4.10) \]

**Second case** \((p = 1)\). We have, for \(H \in \mathfrak{a}^+ \) and \(P(\|H\|) = (1 + \|H\|^d)(1 + \|H\|^2)^{d'} \) as in the first case, that formula (4.7) gives
\[ |h_a(\exp H)\varphi_{-i\eta}(\exp H)| \leq \text{const } P(\|H\|) e^{-2(H_p,H)} e^{-a\|H\|^2} e^{i\eta,H}. \quad (4.11) \]
By the same arguments used in the first case, we get
\[ |h_a(\exp H)\varphi_{-i\eta}(\exp H)| \leq \text{const } e^{(1/4a)\|\eta\|^2}, \quad (4.12) \]
and then
\[ |\mathcal{F}(f)(\lambda)| \leq \text{const } e^{(1/4a)\|\eta\|^2}. \quad (4.13) \]

**Third case** \((p = \infty)\). Since \(h_a^{-1}f\) is in \(L^\infty(G)\), let \(M = \|h_a^{-1}f\|_{\infty}\). By the property (2.4), we have
\[ |\mathcal{F}(f)(\lambda)| \leq M \int_{\mathbb{R}^+} h_a(\exp H)\varphi_{-i\eta}(\exp H)\delta(H)dH. \quad (4.14) \]
Using the spherical Fourier transform of the heat kernel (2.23), we obtain
\[ |\mathcal{F}(f)(\lambda)| \leq \text{const } e^{(1/4a)\|\eta\|^2}. \quad (4.15) \]

**Theorem 4.3.** Suppose \(1 \leq p, q \leq \infty\) with at least one of them finite. Let \(f\) be a measurable \(K\)-bi-invariant function on \(G\) such that
\[ \|h_a^{-1}f\|_{L^p(G)} \leq M, \quad \|e^{b\|\lambda\|^2}\mathcal{F}(f)(\lambda)\|_{L^q(\mathfrak{a}^a_0,|c(\lambda)|^{-2}d\lambda)} \leq M, \quad (4.16) \]
for \(M > 0, a > 0,\) and \(b > 0\). If \(ab \geq 1/4\), then \(f = 0\) almost everywhere.

**Proof.** First, suppose that \(1 \leq q < \infty\) and \(1 \leq p \leq \infty\).
In the basis \(\mu_1, \ldots, \mu_t\) of \(\mathfrak{a}^*\), the second inequality of (4.16) can be written in the form
\[ \int_{\mathbb{R}^+} e^{b\|x_1\mu_1 + \cdots + x_t\mu_t\|^2} \mathcal{F}(f)(x_1\mu_1 + \cdots + x_t\mu_t) |q \times |c(x_1\mu_1 + \cdots + x_t\mu_t)|^{-2} dx_1 \cdots dx_t \leq M. \quad (4.17) \]
By the change of variables \((x_1, \ldots, x_l) = x(1, t_2, \ldots, t_l)\), we have
\[
\int_{\mathbb{R}_+^l} \left( \int_0^\infty |e^{b|x|^2\|\Lambda_t\|^2} \tilde{F}(f)(x\Lambda_t)|^q |c(x\Lambda_t)|^{-2} x^{l-1} dx \right) dt_2 \cdots dt_l \leq M,
\]
where \(\Lambda_t = \mu_1 + t_2 \mu_2 + \cdots + t_l \mu_l\). Fubini’s theorem implies that for almost every \(t_2 > 0, \ldots, t_l > 0\),
\[
\int_0^\infty |e^{b|x|^2\|\Lambda_t\|^2} \tilde{F}(f)(x\Lambda_t)|^q |c(x\Lambda_t)|^{-2} x^{l-1} dx < +\infty. \tag{4.19}
\]
For such \(t_2, \ldots, t_l\), let \(g : \mathbb{C} \to \mathbb{C}\) be the function defined by
\[
g(z) = e^{(1/4a)\|\Lambda_t\|^2\|z\|^2} \tilde{F}(f)(z\Lambda_t). \tag{4.20}
\]
By Remark 4.1 and inequality (4.2), we deduce that \(g\) is an even analytic function on \(\mathbb{C}\), which verifies
\[
|g(z)| \leq \text{const} e^{(1/4a)\|\Lambda_t\|^2\|z\|^2}, \quad z \in \mathbb{C}. \tag{4.21}
\]
Moreover,
\[
\int_0^\infty |g(x)|^q y(x) dx < +\infty, \tag{4.22}
\]
where \(y(x) = |c(x\Lambda_t)|^{-2} x^{l-1}\). Using (2.9) and (2.8), we can see that \(y\) satisfies the hypotheses (3.1) and (3.2). So, by Lemma 3.2, we conclude that \(g = 0\) on \(\mathbb{C}\), and by Lemma 3.5, we conclude that \(\tilde{F}(f) = 0\) on \(a_\mathbb{C}^\ast\). From the injectivity of the transform \(\tilde{F}\), we deduce that \(f = 0\) almost everywhere.

Second, let \(q = \infty\) and \(1 \leq p < \infty\).
We have, by the hypothesis (4.16),
\[
|\tilde{F}(f)(x\Lambda_t)| \leq Me^{-b\|\Lambda_t\|^2 x^2}, \quad x \in \mathbb{R}. \tag{4.23}
\]
The fact that \(ab \geq 1/4\) gives
\[
|\tilde{F}(f)(x\Lambda_t)| \leq Me^{-(1/4a)\|\Lambda_t\|^2 x^2}, \quad x \in \mathbb{R}. \tag{4.24}
\]
By formula (4.2), we have
\[
|\tilde{F}(f)(z\Lambda_t)| \leq \text{const} e^{(1/4a)\|\Lambda_t\|^2|z|^2}, \quad z \in \mathbb{C}. \tag{4.25}
\]
Hence, by Lemma 3.4, we conclude that
\[
\tilde{F}(f)(z\Lambda_t) = C \cdot e^{-(1/4a)\|\Lambda_t\|^2 z^2}
\]
for some constant \(C\), and by Lemma 3.5, we obtain that
\[
\tilde{F}(f)(\lambda) = C \cdot e^{-(1/4a)(\lambda, \lambda)}, \quad \lambda \in a_\mathbb{C}^\ast. \tag{4.27}
\]
Formula (2.23) implies that \(f = \text{const} h_a\).
Now, the hypothesis \(\|h_a^{-1} f\|_{L^p(G)} \leq M\) implies that \(f = 0\) almost everywhere. \(\square\)
From the proof of the precedent theorem we deduce the following results.

**Theorem 4.4.** Let \( p = q = \infty \).

(i) If \( ab > 1/4 \), then every function \( f \) satisfying (4.16) is equal to zero almost everywhere.

(ii) If \( ab = 1/4 \), then the only functions verifying (4.16) are of the form \( f = \text{const} h_a \).

**Remark 4.5.**

(i) This theorem is analogous to the classical theorem of Hardy.

(ii) The case \( ab = 1/4 \) of this theorem is also proved in [13].

We consider now the case \( ab < 1/4 \). We are going to prove that if \( ab < 1/4 \), \( 1 \leq p \), and \( q \leq \infty \), then there are infinitely many functions satisfying conditions (4.16). For this, we need inequality (2.25) which is verified by \( h_t \) for \( a < t < 1/4b \). This inequality is proved at least when \( G/K \) is of rank one or \( G = \text{SL}(3, \mathbb{R}) \), and conjectured by Anker for any noncompact symmetric space.

**Theorem 4.6.** If \( ab < 1/4 \), then for all \( 1 \leq p \), \( q \leq \infty \),

\[
\left\| h_a^{-1} h_t \right\|_{L^p(G)} < \infty, \quad \left\| e^{b\|\lambda\|^2} \mathcal{F}(h_t)(\lambda) \right\|_{L^q(a^2, |c(\lambda)|^{-2} d\lambda)} < \infty.
\] (4.28)

**Proof.** Formulas (2.24) and (2.25) imply that \( h_a^{-1} h_t \leq \text{const} e^{(a-t)\|H\|^2} \). Since \( a < t \), then \( \left\| h_a^{-1} h_t \right\|_{L^p(G)} < \infty \).

The fact that \( \mathcal{F}(h_t)(\lambda) = e^{-(1/4t)((\lambda,\lambda) + \|\rho\|^2)} \) and \( t < 1/4b \) gives the result. \( \square \)

Special Issue on
Time-Dependent Billiards

Call for Papers

This subject has been extensively studied in the past years for one-, two-, and three-dimensional space. Additionally, such dynamical systems can exhibit a very important and still unexplained phenomenon, called as the Fermi acceleration phenomenon. Basically, the phenomenon of Fermi acceleration (FA) is a process in which a classical particle can acquire unbounded energy from collisions with a heavy moving wall. This phenomenon was originally proposed by Enrico Fermi in 1949 as a possible explanation of the origin of the large energies of the cosmic particles. His original model was then modified and considered under different approaches and using many versions. Moreover, applications of FA have been of a large broad interest in many different fields of science including plasma physics, astrophysics, atomic physics, optics, and time-dependent billiard problems and they are useful for controlling chaos in Engineering and dynamical systems exhibiting chaos (both conservative and dissipative chaos).

We intend to publish in this special issue papers reporting research on time-dependent billiards. The topic includes both conservative and dissipative dynamics. Papers discussing dynamical properties, statistical and mathematical results, stability investigation of the phase space structure, the phenomenon of Fermi acceleration, conditions for having suppression of Fermi acceleration, and computational and numerical methods for exploring these structures and applications are welcome.

To be acceptable for publication in the special issue of Mathematical Problems in Engineering, papers must make significant, original, and correct contributions to one or more of the topics above mentioned. Mathematical papers regarding the topics above are also welcome.

Authors should follow the Mathematical Problems in Engineering manuscript format described at http://www.hindawi.com/journals/mpe/. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
