We are interested in the global existence and large-time behavior of solutions to the initial-boundary value problem for critical convective-type dissipative equations

$$u_t + N(u, u_x) + (a_n \partial^n_x + a_m \partial^m_x)u = 0, \quad (x, t) \in \mathbb{R}^+ \times \mathbb{R}^+, \quad u(x, 0) = u_0(x), \quad x \in \mathbb{R}^+, \quad \partial^j_x u(0, t) = 0 \quad \text{for} \quad j = 1, \ldots, m/2,$$

where the constants $a_n, a_m \in \mathbb{R}$, $n, m$ are integers, the nonlinear term $N(u, u_x)$ depends on the unknown function $u$ and its derivative $u_x$ and satisfies the estimate $|N(u, v)| \leq C |u|^\rho |v|^\sigma$ with $\sigma \geq 0, \rho \geq 1$, such that $((n+2)/2n)(\sigma + \rho - 1) = 1, \rho \geq 1, \quad \sigma \in [0, m)$. Also we suppose that $\int_{\mathbb{R}^+} x^{n/2} N dx = 0$. The aim of this paper is to prove the global existence of solutions to the initial-boundary value problem above-mentioned. We find the main term of the asymptotic representation of solutions in critical case. Also we give some general approach to obtain global existence of solution of initial-boundary value problem in critical convective case and elaborate general sufficient conditions to obtain asymptotic expansion of solution.

1. Introduction

We consider the initial-boundary value problem on a half-line for critical nonlinear dissipative equations of convective type:

$$u_t + N(u, u_x) + \mathbb{K}(u) = 0, \quad t > 0, \quad x > 0,$$

$$\partial^j_x u(0, t) = 0, \quad t > 0, \quad j = 1, \ldots, M,$$

$$u(x, 0) = u_0(x), \quad x > 0. \quad (1.1)$$

The linear part of (1.1) is a differential operator

$$\mathbb{K}(u) = a_n \partial^n_x + a_m \partial^m_x, \quad (1.2)$$

where $a_n, a_m \in \mathbb{R}$, $n, m$ are integers, $m > n$. Note that the operator $\mathbb{K}(u)$ has the
2 Critical dissipative equations

symbol

\[ K(p) = a_n p^n + a_m p^m. \] (1.3)

In this paper, we suppose that the dissipation condition is fulfilled:

\[ \text{Re} K(p) > 0 \quad \text{for} \; \text{Re} \; p = 0, \; p \neq 0. \] (1.4)

We assume that the nonlinearity \( N(u, u_x) \) satisfies the estimate

\[ |N(u, v)| \leq C |u|^\rho |v|^\sigma \] (1.5)

with \( \rho, \sigma \geq 0 \) and is of convective type such that

\[ \int_0^{+\infty} x^{n/2} N(u, u_x) \, dx = 0 \] (1.6)

and for any \( q \in \mathbb{C} \),

\[ N(vq) = q^{\sigma+p} N(v). \] (1.7)

The number of the boundary data \( M = m/2 \) (or \( M = (m + 1)/2 \) in the case of odd integer \( m \) and \( a_m < 0 \) ) (see book [7]). Equation (1.1) is a simple universal model, which appears as the first approximation in the description of the dispersive dissipative nonlinear waves (see [14]).

The global existence and large-time asymptotic behavior of solutions to the Cauchy problems for nonlinear local and nonlocal equations were studied in many works (see [1–6, 8, 9, 12, 13, 15] and literature cited therein).

In papers [10, 11], the large-time asymptotic behavior of solutions to the Korteweg-de Vries-Burgers-type equations on a half-line in the super critical case was found. A general theory of nonlinear nonlocal homogeneous equations on a half-line was developed in book [7]. In the present paper, we consider (1.1) in the case of operator \( K \) with nonhomogeneous symbol \( K(p) \). As a typical example, we take a polynomial \( K(p) = a_n p^n + a_m p^m \).

We are interested in the global existence and large-time behavior of solutions to the initial-boundary value problem (1.1) in the critical convective-type case, when the nonlinear term of equation has the same time decay rate as that of the linear terms and has zero moment. Also in this paper, we give some general approach to obtain global existence of solution of initial-boundary value problem in critical convective case. We elaborate general sufficient conditions to obtain asymptotic expansion of solution.

We denote the usual Lebesgue space as \( L^p \) on \( \mathbb{R}^+ \) by the norm \( \| \phi \|_{L^p} = (\int_{\mathbb{R}^+} |\phi(x)|^p \, dx)^{1/p} \), and the weighted Lebesgue space as \( L^{p, \alpha} \), \( \alpha \geq 0 \), with norm

\[ \| \phi \|_{L^{p, \alpha}} = \| (\cdot)^{\alpha} \phi \|_{L^p}, \quad \langle x \rangle = \sqrt{1 + |x|^2}. \] (1.8)

Also we introduce the weighted Sobolev space

\[ W^{k,\alpha}_p = \left\{ \phi \in L^{p, \alpha}, \sum_{j=0}^k \| \partial_x^j \phi \|_{L^p, \alpha} < \infty \right\}. \] (1.9)
By $\mathbf{C}(I; B)$ we denote the space of continuous functions from a time interval $I$ to the Banach space $B$. We denote $\{x\} = x/\langle x \rangle$.

We assume that the initial data $u_0 \in L^\infty \cap L^{1, n/2+1}$ and satisfies condition

$$
\|u_0\|_{L^\infty} + \|u_0\|_{L^{1, n/2+1}} < \varepsilon, \quad (1.10)
$$

where $\varepsilon > 0$ is sufficiently small. We assume that the nonlinear term $N(u, u_x)$ is of critical convective type from the point of view of the large-time asymptotic behavior, that is, the orders $\sigma$ and $\rho$ of the nonlinear term satisfy the following condition:

$$
\frac{n+2}{2n}(\sigma + \rho - 1) = 1, \quad \rho \geq 1, \sigma \in [0, m), \quad (1.11)
$$

$$
\int_{\mathbb{R}^+} x^{n/2} N dx = 0. \quad (1.12)
$$

We denote

$$
G_1(s, q) = \frac{1}{2\pi i} \int_{i\infty}^{i\infty} e^{-sa} \left( e^{a(s-q)} - \sum_{j=1}^{n/2} A_j e^{-a(s+rq)} \right) dz,
$$

$$
(1.13)
$$

$$
A_j = \prod_{k=1, k \neq j}^{n/2} \frac{1 + r_k}{1 - r_k}, \quad a_n r^n = -1, \quad \text{Re} r_k > 0.
$$

Our purpose in this paper is to prove the following result.

**Theorem 1.1.** Assume that the conditions (1.10)-(1.11) are valid. Then there exists a unique solution

$$
u(t, x) \in \mathbf{C}([0, \infty); L^\infty \cap L^{1, n/2+1}) \cap \mathbf{C}((0, \infty); W^{1,0}_\infty \cap W^{1, n/2+1}_1) \quad (1.14)
$$

of the initial-boundary value problem (1.1). Furthermore, there exists a function $V \in L^\infty$ such that the asymptotic formula

$$
\|\langle t \rangle^r (u(t) - t^{-(n+2)/2n} V((\cdot)t^{-1/n}))\|_{L^\infty} \leq C\varepsilon \quad (1.15)
$$

is valid for $t \to \infty$ uniformly with respect to $x \in \mathbb{R}^+$, where $Q = n/2, \gamma = ((1/2)\mu, 1 - \sigma/m)$, and $V(\xi)$ is the solution of the integral equation

$$
V(\xi) = f(u_0) G_0(\xi) - \frac{1}{\beta} \int_0^1 \frac{dz}{z^{(n+2)/2n}(\rho + \sigma)(1 - z)^{1/n}}
$$

$$
\times \int_{\mathbb{R}^+} G_1 \left( \frac{\xi}{(1 - z)^{1/n}}, \frac{yz^{1/n}}{(1 - z)^{1/n}} \right) N(V(y)) dy,
$$

$$
(1.16)
$$

where

$$
f(u_0) = \int_{\mathbb{R}^+} x^Q u_0 dx. \quad (1.17)
$$
We organize the rest of our paper as follows. In Section 2, we give general theory of studying initial-boundary value problem in the case of critical convective type of non-linearity. In Sections 3 and 4, we construct the Green function of the solution of the linear problem. We prove preliminary lemmas in Section 5. In Lemma 5.1, we obtain estimates of the Green operator in the Lebesgue spaces $L^r, 1 \leq r \leq \infty$, and $L^{1, Q+1}$. Then in Lemma 5.3, we estimate the Green operator in our basic norm

$$
\|\phi\|_X = \sup_{t>0} \left( \sum_{k=0}^{1} \left\{ t \right\}^{k/m} \left( \frac{Q+k}{n+1/n}(1-1/r) \right) \|\partial_x^k \phi(t)\|_{L'} + \left\{ t \right\}^{k/m} \left( \frac{k-1}{n} \right) \|\partial_x^k \phi(t)\|_{L^{1, Q+1}} \right).
$$

2. General approach

Suppose we can rewrite the initial-boundary value problem (1.1) as the following integral equation:

$$
u(t) = \mathcal{G}(t)u_0 - \int_0^t \mathcal{G}(t-\tau)\mathcal{N}(u(\tau))d\tau, \quad (2.1)
$$

where $\mathcal{G}$ is the Green operator of the corresponding linear problem. Here $\mathcal{N}(u)$ is some nonlinear operator such that for any $q \in \mathbb{C}$,

$$
\mathcal{N}(vq) = q^{\alpha+1}\mathcal{N}(v). \quad (2.2)
$$

In this section, we prove global-in-time existence of solutions to the problem (1.1). By the global solution of the problem (1.1), we always understand the solution $u(t)$ of the corresponding integral equation (2.1), belonging to some complete metric space $X$ of functions defined on $[0, \infty) \times \mathbb{R}^+$ (the so-called mild solution).

We fix a metric space $Z$ of functions defined on $\mathbb{R}^+$.

We suppose that there exists the asymptotic kernel $\widetilde{G}_0(x, t) = t^{-\alpha}G_0(xt^{-1/n}) \in X$ in spaces $X, Z$, such that

$$
\|\left( t^{\gamma} (\mathcal{G}(t)\phi - G_0f(\phi)) \right) \|_X \leq C \|\phi\|_Z, \quad (2.3)
$$

with some $\alpha > 0, n > 0$, where $f(\phi)$ is the linear functional: $Z \to \mathbb{R}$ and

$$
f(t^{-\alpha}\phi((\cdot) t^{-1/n})) = f(\phi) \quad (2.4)
$$

for all $t > 0, \phi \in Z$.

We also fix a metric space $W$ of functions defined on $\mathbb{R}^+$, such that the norm of $W$ is induced by the norm of $X$ by the relation

$$
\|\phi\|_W = \|t^{-\alpha}\phi((\cdot) t^{-1/n})\|_X. \quad (2.5)
$$
Theorem 2.1. Assume that the initial data $u_0 \in Z$, and it is such that $\|u_0\|_Z < \varepsilon$. Let there exist function $G_1(x,y)$ ($G_1(x,0) = 0$) such that for operator

$$
\mathcal{G}_0(t) \phi = t^{-\beta} \int_{\mathbb{R}^+} G_1(xt^{-1/n}, yt^{-1/n}) \phi(y) dy,
$$

(2.6)

the following estimates with $\gamma > 0$ exist:

$$
\|\mathcal{G}_0(t) \phi\|_X + \|(t)\gamma (\mathcal{G}_0(t) - \mathcal{G}_0(t)) \phi\|_X \leq C\|\phi\|_Z,
$$

(2.7)

and if $f(\phi) = 0$,

$$
\left\|\int_0^t (\mathcal{G}_0(t) - \mathcal{G}_0(t)) \phi(\tau) d\tau\right\|_X \leq C\|\phi(t)\|_X,
$$

(2.8)

$$
\left\|\langle t \rangle\gamma \int_0^t (\mathcal{G}_0(t) - \mathcal{G}_0(t)) \phi(\tau) d\tau\right\|_X \leq C\|\phi(t)\|_X.
$$

(2.9)

Also, suppose that the nonlinearity $\mathcal{N}$ in (1.1) is a critical convective such that $f(\mathcal{N}(u)) = 0$ for any $u \in X$,

$$
\|(\mathcal{N}(u_1) - \mathcal{N}(u_2))\|_X \leq C\|(u_1 - u_2)\|_X (\|u_1\|_X^{\sigma_2} + \|u_2\|_X^{\sigma_2}),
$$

(2.10)

$$
\sigma_1 \alpha + \beta = 1 + \frac{1}{n}.
$$

(2.11)

Then there exists a unique global solution $u \in C([0, \infty); X)$ of the initial- boundary value problem (1.1). Furthermore, there exists a function $V \in W$ such that the asymptotic formula

$$
\left\|\langle t \rangle\gamma (u(t) - t^{-\alpha} V(\cdot t^{-1/n}))\right\|_X \leq C\varepsilon
$$

(2.12)

is valid for $t \to \infty$ uniformly with respect to $x \in \mathbb{R}^+$, where $V(\xi)$ is the solution of the integral equation

$$
V(\xi) = f(u_0) G_0(\xi) - \int_0^1 \mathcal{G}_0(1 - z) \mathcal{N}(z^{-\alpha} V(\cdot z^{-1/n})) \, dz.
$$

(2.13)

Proof. We prove the existence of the solution $u(x, t)$ for the initial-boundary value problem (1.1) by the successive approximations $u_m(x,t)$, $m = 1, 2, \ldots$, defined as follows:

$$
\partial_t u_m + \mathcal{G}(u_m) = \mathcal{N}(u_{m-1}), \quad v_m(0,x) = v_0(x),
$$

(2.14)

for all $m \geq 2$, where

$$
u_1 = \mathcal{G}_0(t) u_0.
$$

(2.15)

The integral equation associated with (1.1) is written as

$$
u_m(t) = \mathcal{G}(t) u_0 - \int_0^t \mathcal{G}(t - \tau) \mathcal{N}(u_{m-1}) d\tau.
$$

(2.16)
We now prove by induction the following estimates for all $m \geq 1$:

\[
\|u_m\|_X \leq C\varepsilon, \quad \|u_m(t) - \mathcal{G}(t)u_0\|_X \leq C\varepsilon.
\] (2.17)

From (2.7), we have

\[
\|\mathcal{G}_0(t)u_0\|_X \leq C\varepsilon, \quad \|u_1 - \mathcal{G}(t)u_0\|_X \leq C\varepsilon.
\] (2.18)

Therefore estimates (2.17) are valid for $m = 1$. We assume that estimates (2.17) are true with $m$ replaced by $m - 1$. Due to (2.10), we have

\[
\|\mathcal{N}(u)\|_X \leq C\|u\|^{q+1}_X.
\] (2.19)

Since $x^0\mathcal{N}(u_{m-1}(\tau))$ have the zero-mean value via (2.8) and (2.9), we get

\[
\left\|\int_0^t \mathcal{G}(t-\tau)\mathcal{N}(u_{m-1}(\tau))d\tau\right\|_X \leq \int_0^t \mathcal{G}_0(t-\tau)\mathcal{N}(u_{m-1}(\tau))d\tau

+ \int_0^t (\mathcal{G}(t-\tau) - \mathcal{G}_0(t-\tau))\mathcal{N}(u_{m-1}(\tau))d\tau \leq \|\mathcal{N}(u_{m-1})\|_X \leq C\varepsilon.
\] (2.20)

It follows that

\[
\|u_m\|_X \leq C\varepsilon, \quad \|u_m(t) - \mathcal{G}(t)u_0\|_X \leq C\varepsilon.
\] (2.21)

Thus by induction, we see that estimates (2.17) are valid for all $m \geq 1$. In the same way by induction, we can prove that

\[
\|u_m - u_{m-1}\|_X \leq \frac{1}{4} \|u_{m-1} - u_{m-2}\|_X,
\] (2.22)

for all $m > 2$. Therefore taking the limit $m \to \infty$, we obtain a unique solution $\lim_{m \to \infty} u_m(t, x) = u(t,x) \in X$, satisfying the equation

\[
u(t) = \mathcal{G}(t)u_0 - \int_0^t \mathcal{G}(t-\tau)\mathcal{N}(u)d\tau,
\] (2.23)

and estimates for $t > 1$,

\[
\|u(t) - \mathcal{G}(t)u_0\|_X \leq C\varepsilon, \quad \|u(t)\|_X \leq C\varepsilon.
\] (2.24)

We now compute the asymptotics of the solution. First, we show the existence of solutions to the integral equation

\[
V(\xi) = V_0(\xi) - \int_0^1 \mathcal{G}_0(1-z)\mathcal{N}(z^{-a}V((\cdot)z^{-1/n}))dz,
\] (2.25)
where \( V_0(\xi) = \theta G_0(\xi) \), where
\[
\theta = f(u_0). \tag{2.26}
\]

We prove the existence of the solution \( V \) for integral equation (2.25) by the contraction mapping principle. We define the transformation \( \mathcal{R}(V) \) by the formula
\[
\mathcal{R}(V) = \theta G_0 - \int_0^1 G_0(1-z,\xi)N(z^{-a}V((\cdot)z^{-1/n})) \, dz, \tag{2.27}
\]
for any \( V \in W_\rho \), where
\[
W_\rho = \{ V \in W : \| V \|_W \leq \rho \} \tag{2.28}
\]
and \( C|\theta| \leq \rho \) and \( \rho > 0 \) sufficiently small. First we check that the mapping \( \mathcal{R} \) transforms the set \( W_\rho \) into itself. By the property (2.34) using relation of the norms \( W \) and \( X \), we have for \( v(t,x) = t^{-a}V(xt^{-1/n}) \),
\[
\| \mathcal{R}(V) \|_W \leq \| \theta G_0 \|_W + \left\| \int_0^1 G_0(1-z,\xi)N(z^{-a}V((\cdot)z^{-1/n})) \, dz \right\|_W \\
\leq C|\theta| + \left\| t^a \int_0^1 G_0(t-\tau,\xi t^{1/n})N(v(\tau)) \, d\tau \right\|_W \tag{2.29}
\]
\[
= C|\theta| + \left\| \int_0^t G_0(t-\tau)N(v(\tau)) \, d\tau \right\|_X.
\]

Then due to (2.8), we get
\[
\left\| \int_0^t G_0(t-\tau)N(v(\tau)) \, d\tau \right\|_X \leq C\| v \|_X^{q+1} = C\| V \|_Q^{q+1} \leq C\rho^{q+1}. \tag{2.30}
\]

Hence \( \| \mathcal{R}(V) \|_W \leq C|\theta| + C\rho^{q+1} \leq C\rho \) if \( \rho > 0 \) is small. In the same manner, we estimate the difference, denoting that \( w(t,x) = t^{-a}W(xt^{-1/n}) \) and using the relation of the norms \( W \) and \( X \),
\[
\| \mathcal{R}(V) - \mathcal{R}(W) \|_W \leq \left\| \int_0^1 G_0(1-z,\xi)(N(z^{-a}V((\cdot)z^{-1/n})) - N(z^{-a}W((\cdot)z^{-1/n}))) \, dz \right\|_W \\
= \left\| \int_0^t G_0(t-\tau)(N(v(\tau)) - N(w(\tau))) \, d\tau \right\|_X \\
\leq \frac{1}{2} \| V - W \|_W (\| V \|_W^{q_1} + \| W \|_W^{q_1}) \leq C\rho^{q_1} \| V - W \|_W \leq \frac{1}{2} \| V - W \|_W. \tag{2.31}
\]

Therefore, \( \mathcal{R} \) is a contraction mapping in the closed set \( W_\rho \) of a complete metric space \( X \). Hence, there exists a unique solution \( V \in W_\rho \) to the integral equation (2.25). We now prove that self-similar solutions \( V(\xi) \) give us the asymptotics of solutions to the problem
8 Critical dissipative equations

(1.1). Denote \( v(t) = t^{-a} \theta V((\cdot)t^{-1/n}) \), where \( V \) satisfies integral equation (2.25), then we have

\[
v(t) = \theta t^{-a}G_0((\cdot)t^{-1/n}) - \int_0^t G_0(t - \tau)\mathcal{N}(v(\tau)) d\tau. \tag{2.32}
\]

Since \( u(t) \) satisfies the integral equation (2.1),

\[
u(t) = \mathcal{G}(t)u_0 - \int_0^t \mathcal{G}(t - \tau)\mathcal{N}(u(\tau)) d\tau, \tag{2.33}
\]

we write for the difference

\[
\| \langle t \rangle^\gamma (v(t) - v(t)) \|_X \leq \| \langle t \rangle^\gamma (\mathcal{G}(t)u_0 - \theta t^{-a}G_0((\cdot)t^{-1/n})) \|_X \]

\[
+ \| \langle t \rangle^\gamma \int_0^t \mathcal{G}(t - \tau)(\mathcal{N}(u(\tau)) - \mathcal{N}(v(\tau))) d\tau \|_X
\]

\[
+ \| \langle t \rangle^\gamma \int_0^t (\mathcal{G}(t - \tau) - \mathcal{G}_0(t - \tau))\mathcal{N}(v(\tau)) d\tau \|_X \tag{2.34}
\]

\[
eq I_1 + I_2 + I_3.
\]

Note that in view of the relation of the norms \( X \) and \( W \), we have

\[
\| v \|_X = |\theta| \| V \|_W \leq C|\theta| \leq C\varepsilon. \tag{2.35}
\]

Then by the definition of the asymptotic kernel (see (2.3)), we obtain

\[
I_1 = \| \langle t \rangle^\gamma (\mathcal{G}(t)u_0 - \theta t^{-a}G_0((\cdot)t^{-1/n})) \|_X \leq C \| u_0 \|_Z \leq C\varepsilon. \tag{2.36}
\]

By virtue of condition (2.8), we get

\[
I_2 = \| \langle t \rangle^\gamma \int_0^t \mathcal{G}(t - \tau)(\mathcal{N}(u(\tau)) - \mathcal{N}(v(\tau))) d\tau \|_X
\]

\[
\leq C\| \langle t \rangle^\gamma (u(t) - v(t)) \|_X (\| u \|_X^\sigma + \| v \|_X^\sigma) \tag{2.37}
\]

\[
\leq C\varepsilon^\sigma \| \langle t \rangle^\gamma (u(t) - v(t)) \|_X
\]

and via condition (2.9), we find

\[
I_3 = \| \langle t \rangle^\gamma \int_0^t (\mathcal{G}(t - \tau) - \mathcal{G}_0(t - \tau))\mathcal{N}(v(\tau)) d\tau \|_X \tag{2.38}
\]

\[
\leq C\| v \|_X^{\sigma+1} \leq C\| V \|_W^{\sigma+1} \leq C\| \theta \|^{\sigma+1} \leq C\varepsilon^{\sigma+1}.
\]

Now (2.34) implies that

\[
\| \langle t \rangle^\gamma (u(t) - v(t)) \|_X \leq C\varepsilon + C\varepsilon^\sigma \| \langle t \rangle^\gamma (u(t) - v(t)) \|_X, \tag{2.39}
\]

hence estimate (2.12) follows since \( \varepsilon > 0 \) is small enough. Theorem 2.1 is proved. □
3. Linear problem

We consider the linear initial-boundary value problem corresponding to (1.1):

\[ u_t + \mathbb{K}u = f(x,t), \quad t > 0, \quad x > 0, \]
\[ u(x,0) = u_0(x), \quad x > 0, \]
\[ \partial_x^{j-1}u(0,t) = h_j(t), \quad t > 0, \text{ for } j = 0, \ldots, M. \]  

(3.1)

We define symbol of operator \( \mathbb{K} \) as

\[ K(p) = a_n p^n + a_m p^m, \]

(3.2)

where \( n, m \) are even integers, \( n \leq m/2 + 1, a_n \neq 0, a_m \neq 0 \). We denote by \( \phi_j(\xi) = K^{-1}(-\xi), j = 1, \ldots, N = m/2, \) different roots of equation for equation \( K(p) = -\xi \), such that

\[ \text{Re} \phi_j(\xi) > 0 \]  

(3.3)

for all \( \xi \in D, \text{Re} \xi > 0 \). Here \( D \) is domain of analyticity of functions \( \phi_j(\xi) \) with boundary

\[ \Gamma = \left\{ (-i\infty, -i0) \cup \left( [-i0, K(p_k) e^{i2\pi}] \cup [K(p_k), i0] \right) \cup (i0, i\infty) \right\}, \]

(3.4)

where \( K'(p_k) = 0 \). Also we define the matrix

\[
A = \begin{pmatrix}
\phi_1^{N-1} & \phi_1^{N-2} & \phi_1^{N-3} & \ldots & 1 \\
\phi_2^{N-1} & \phi_2^{N-2} & \phi_2^{N-3} & \ldots & 1 \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
\phi_N^{N-1} & \phi_N^{N-2} & \phi_N^{N-3} & \ldots & 1
\end{pmatrix}
\]

(3.5)

and the vector

\[
\overrightarrow{B} = \begin{pmatrix}
e^{-\phi_1(\xi)y} \\
e^{-\phi_2(\xi)y} \\
\ldots \\
e^{-\phi_N(\xi)y}
\end{pmatrix}
\]

(3.6)

In this section, we follow the method of the book [7] to obtain the explicit formula for the solution of the linear problem (3.1) under the condition

\[ u_0 \in L^1(\mathbb{R}^+), \quad f \in L^q(0,T; L^1(\mathbb{R}^+)) \]

(3.7)

with \( q > 2 \). We have that solution of problem (3.1) has the following form:

\[ u(x,t) = \int_0^{+\infty} u_0(y)G(x,y,t)dy + \int_0^t d\tau \int_0^{+\infty} f(x,y,\tau)G(x,y,t-\tau)dy, \]

(3.8)
10 Critical dissipative equations

where

\[
G(x,y,t) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{px} H(p,y,t) dp,
\]

\[
H(p,y,t) = e^{-py-K(p)t} - \sum_{j=1}^{N} p^{N-j} \frac{1}{2\pi i} \int \frac{e^{\xi t}}{K(p)+\xi} (\mathbb{A}_0^{-1} \mathbb{B})_j dp.
\]  

(3.9)

Denote

\[
\tilde{H}(p,\phi_1,\phi_2,\ldots,\phi_N,y) = \sum_{k=1}^{N} p^{N-k} (\mathbb{A}_0^{-1} \mathbb{B})_k.
\]  

(3.10)

We write function \(\tilde{H}\) in the form

\[
\tilde{H} = \sum_{k=1}^{N} p^{N-k} e^{-\phi_j y} (\mathbb{A}_0^{-1} \mathbb{E}_j)_k,
\]  

(3.11)

where \(\mathbb{E}_j\) is vector with component \(e_l, l = 1,\ldots,N,\)

\[
e_l = \begin{cases} 
1, & l = j, \\
0, & l \neq j.
\end{cases}
\]  

(3.12)

Using the results of book [7], we have

\[
\left(\mathbb{A}_0^{-1} \mathbb{E}_j\right)_k = (-1)^{k-1} \sigma_{k-1}(\phi_1,\phi_2,\ldots,\phi_{k-1},\phi_{k+1},\ldots,\phi_N) \prod_{l=1,l\neq k}^{N} (\phi_k - \phi_l)^{-1},
\]  

(3.13)

where \(\sigma_k\) are symmetrical polynomials, such that

\[
\sigma_0(\phi_2,\ldots,\phi_N) = 1,
\]

\[
\sigma_1(\phi_2,\ldots,\phi_N) = \sum_{j=2}^{N} \phi_j,
\]

\[
\sigma_2(\phi_2,\ldots,\phi_N) = \sum_{j+k} \phi_j \phi_k,
\]

\[
\vdots
\]

\[
\sigma_N(\phi_2,\ldots,\phi_N) = \prod_{j=2}^{N} \phi_j.
\]  

(3.14)

Therefore from the Viett theorem, we obtain

\[
\tilde{H} = \sum_{j=1}^{N} e^{-\phi_j y} P_N(p) \frac{e^{\phi_j y} P_N(p)}{P'_N(\phi_j)(p-\phi_j)},
\]  

(3.15)
where by $P_N(p)$, we denote

$$P_N(p) = \prod_{l=1}^{N} (p - \phi_l). \quad (3.16)$$

We easily see that function $\tilde{H}(p, \phi_1, \phi_2, \ldots, \phi_N, y)$ is symmetrical with respect to variables $\phi_j(\xi)$, such that, for example,

$$\tilde{H}(p, \phi_1, \phi_2, \ldots, \phi_N, y) = \tilde{H}(p, \phi_2, \phi_1, \ldots, \phi_N, y). \quad (3.17)$$

Since $\Re K(p) > 0$ for all $\Re p = 0$, $p \neq 0$ and the function $\tilde{H}(p, \phi_1, \ldots, \phi_N, y)$ is analytic in the domain $D$ and has the estimate

$$|\tilde{H}(p, \phi_1, \ldots, \phi_N, y)| \leq C e^{-C_y \sqrt{|\xi|}} \quad (3.18)$$

for $|\xi| \to \infty$, $\Re \xi > 0$ (see asymptotic formulas (4.2)), therefore by the Cauchy theorem and symmetrical properties of function $\tilde{H}$, we can change the contour of integration $\Gamma$ to the imaginary axis ($-i\infty, i\infty$) to get

$$\int_{\Gamma} \tilde{H}(p, \phi_1, \ldots, \phi_N, y) e^{\xi x} dp = \int_{-i\infty}^{i\infty} \tilde{H}(p, \phi_1, \ldots, \phi_N, y) e^{\xi x} dp, \quad (3.19)$$

(since $\Re \phi_j(\xi) > 0$ for all $\Re \xi = 0$, and taking into account inequality (3.18), we see that the last integral in the above formula converges absolutely). Applying the identities

$$K'(\phi_l) = -\frac{1}{\phi_l'(\xi)} \quad (3.20)$$

and using the theory of residues, we obtain

$$\int_{-i\infty}^{i\infty} \frac{\tilde{H}(p, \phi_1, \ldots, \phi_N, y)}{K(p) + \xi} e^{\xi x} dp = 2\pi i \sum_{l=1}^{M} \tilde{H}(\phi_{l+N}, \phi_1, \ldots, \phi_N, y) e^{\phi_{l+N}(\xi)x} \phi_l'(\xi), \quad (3.21)$$

where $\phi_{l+N}$ are “negative” roots of equation for equation $K(p) = -\xi$, such that

$$\Re \phi_j(\xi) < 0, \quad \Re \xi > 0. \quad (3.22)$$

For any $\phi_k(\xi)$, $k = 1, \ldots, N$, there exists the function $\phi_j(\xi)$, $j = 1, \ldots, N$, such that

$$\phi_k(-\xi) = \phi_j(\xi), \quad \Re \xi = 0. \quad (3.23)$$
Therefore taking into account symmetrical properties of function $\tilde{H}$ after the change of variable $p = \phi_{l+N}(\xi)$, we get

\[
\frac{1}{4\pi^2} \int_{-\infty}^{\infty} e^{px} \int_{-\infty}^{\infty} \sum_{j=1}^{N} p^{N-j} \int_{\Gamma} \frac{e^{\xi t}}{K(p) + \xi} (A^{-1} B)_{j} \, d\xi
\]

\[
= -\frac{1}{2\pi i} \sum_{l=1}^{M} \int_{-\infty}^{\infty} e^{\xi t} \tilde{H}(\phi_{l+N}, \phi_1, \phi_2, \ldots, \phi_N, y) e^{\phi_{l+N}(\xi) \phi'_{l+N}(\xi)} d\xi
\]

\[
= -\frac{1}{2\pi i} \sum_{l=1}^{M} \int_{\Gamma_l} e^{px-K(p)t} \tilde{H}(p, \phi_1(K(p)), \phi_2, \ldots, \phi_N, y) \, dp
\]

\[
= \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{px-K(p)t} \tilde{H}(p, \phi_1(K(p)), \phi_2, \ldots, \phi_N, y) \, dp,
\]

where

\[
\Gamma_l = \{ p = \phi_{l+N}(\xi), \text{Re}\xi = 0 \}.
\]

Therefore taking into account (3.15), (3.24), we obtain the following integral representation for Green function $G(x, y, t)$ of problem (3.1):

\[
G(x, y, t) = F_1(x - y, t) + F_2(x, y, t),
\]

\[
F_1(x, t) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{px-K(p)t} d\rho,
\]

\[
F_2(x, y, t) = \frac{1}{2\pi i} \sum_{j=1}^{N} \int_{-\infty}^{\infty} e^{px-K(p)t} \frac{e^{-\phi_j(K(p)) y} P_N(p)}{P'_N(\phi_j)(p - \phi_j)} \, dp,
\]

where the function $P_N$ is defined in (3.16).

4. Asymptotics of the Green function

If $K(p) = a_n p^n + a_m p^m$, $m > n$, then there exist $M_1 = m/2$ different inverse functions $\phi_j(\xi) = K^{-1}(-\xi)$, such that for $\xi \in D$ (see book [7]),

\[
\text{Re} \phi_j(\xi) > 0.
\]

Moreover, the asymptotics

\[
\phi_l(\xi) = e^{i(\pi + 2\pi l)(1/m)} (a_m^{-1} \xi)^{1/m} + O(\xi^{-(1-y)/m})
\]

is true as $\xi \to \infty$, with $y > 0$. Now we consider case $\xi \to 0$.

We represent

\[
p^n = \frac{1}{a_n} \frac{-\xi}{1 + O(p)} \quad \text{or} \quad p^{m-n} = \frac{a_n}{a_m} \left( -1 + \frac{-\xi}{a_n p^n} + O(p) \right) \quad \text{for} \, |p| \leq 1.
\]
Hence we get the asymptotic representations for $l = 1, \ldots, Q = n/2$,

$$
\phi_l(\xi) = \beta_l \xi^{1/n} + O(|\xi|^{2/n}), \quad \xi \to 0,
$$  \hspace{1cm} (4.4)

where $\beta_l$ are the roots of the equation $a_n z^n + 1 = 0$, such that $\text{Re } \beta_l \xi^{1/n} > 0$ for all $\text{Re } \xi > 0$.

For $l = Q + 1, \ldots, N$, we have

$$
\phi_{l+j}(\xi) = r_j + O(|\xi|^{2/n}), \quad \xi \to 0,
$$  \hspace{1cm} (4.5)

where $r_j$ are the roots of the equation $a_n + a_m z^{m-n} = 0$, such that $\text{Re } r_j > 0$.

We have (see (3.26))

$$
G(x, y, t) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{px - K(p)t} H(p, y) dp,
$$  \hspace{1cm} (4.6)

$$
H(p, y) = e^{-py} + \sum_{j=1}^{N} \frac{e^{-\phi_j(K(p))} P_N(p)}{P_N'(\phi_j)(p - \phi_j)}.
$$  \hspace{1cm} (4.7)

Since for $l = 0, \ldots, N - 1$, $\text{Re } p = 0$,

$$
\sum_{j=1}^{N} \frac{\phi_j^l P_N(p)}{P_N'(\phi_j)(p - \phi_j)} = \frac{P_N(p)}{2\pi i} \int_{-\infty}^{\infty} \frac{u^l}{P_N(u)(p - u)} du = -p^l,
$$  \hspace{1cm} (4.8)

we have

$$
H(p, y) = e^{-py} - \sum_{l=1}^{N-1} \frac{(-py)^l}{l!} + \sum_{j=1}^{N} \tilde{B}(\phi_j(K(p))) \frac{P_N(p)}{P_N'(\phi_j)(p - \phi_j)}.
$$  \hspace{1cm} (4.9)

where

$$
\tilde{B}(z) = e^{-zy} - \sum_{l=0}^{N-1} (-1)^l \frac{(zy)^l}{l!}.
$$  \hspace{1cm} (4.10)

Therefore using (4.4)-(4.5) and symmetrical properties of function $H(p, y)$, we obtain for $|p| \ll 1$,

$$
\sum_{j=1}^{n/2} \tilde{B}(\phi_j(K(p))) \frac{P_N(p)}{P_N'(\phi_j)(p - \phi_j)} = O(p^{Q+1}y^{Q+1}).
$$  \hspace{1cm} (4.11)
Also by definition, we have
\[ \Pi^N_j \phi_j^2 = \frac{(-1)^N}{a_m} (a_n p^n + a_m p^m), \quad a_m P_N(p) P_N(-p) = (-1)^N 2K(p). \] (4.12)

Therefore using (4.4)-(4.5), we get with \( Q = n/2 \) that
\[
\sum_{k=Q+1}^{N} \tilde{B}(\phi_k(K(p))) \frac{P_N(p)}{P_N(\phi_k)(p - \phi_k)}
\]
\[
= \sum_{k=Q+1}^{N} \tilde{B}(\phi_k(K(p))) \frac{P_N(p) P_N(-\phi_k)}{P_N(\phi_k) P_N(-\phi_k)(p - \phi_k)}
\]
\[
= \sum_{k=Q+1}^{N} \tilde{B}(\phi_k(K(p))) \frac{a_m \Pi^N_j (\phi_j + \phi_k) (\phi_j - p)}{2(a_n n \phi_k^{n-1} + a_m m \phi_k^{m-1})(p - \phi_k)}
\]
\[
= \frac{a_m}{2} \sum_{k=Q+1}^{N} \tilde{B}(\phi_k(K(p))) \frac{\Pi^N_j \phi_j^2 + \phi_k^{N-1} \phi_j + (-p)^N \Pi^N_j \phi_j + \phi_k^N (-p)^N}{-r_k^n (a_n n + a_m m r_k^{m-n})}
\]
\[
+ O(p^{Q+1}(1 + y^{Q+1}))
\]
\[
= p^Q \sqrt{\frac{a_m}{a_n} \frac{(-1)^{N/2}}{2(m - n)}} \sum_{k=1}^{N-Q} \tilde{B}(r_k) r_k^{N-n} + O(p^{Q+1}(1 + y^{Q+1})),
\] (4.13)

where \( r_k \) was defined in (4.4), (4.5).

Substituting (4.11)–(4.13) into (4.7), we easily get
\[
H(p, y) = D_1 p^{n/2} B(y) + O(p^{n/2+1}(1 + y^{n/2+1})),
\] (4.14)

where constant \( D_1 \) is defined by
\[
D_1 = \sqrt{\frac{i^n a_m}{i^n a_n} \frac{n^{n/2}}{2(m - n)}},
\] (4.15)

and function
\[
B(y) = \sum_{j=1}^{N-n/2} r_j^{N-n} \left( e^{-r_j y} - \sum_{l=0}^{n/2} (-1)^l \frac{(r_j y)^l}{l!} \right).
\] (4.16)
Note that for $|p| > 1$,
\[ |H(p, y)| < C. \tag{4.17} \]

Making the change of variable $p^n t = z^n$, we obtain for Green function with $x_1 = x t^{-1/n}$ that
\[
G(x, y, t) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{px - K(p)t} H(p, y) dp \\
= \frac{1}{2\pi i} \left( \int_{-i}^{i} e^{px - a_n p^n t} (D_1 p^Q B(y) + O(p^{Q+1}(1 + y^{Q+1}))) dp \\
+ \int_{-i}^{i} e^{px - a_n p^n t} (e^{-C p^{n t}} - 1) O(p^{Q}(1 + y^{Q+1})) dp \\
+ \int_{-\infty, |p| > 1}^{i\infty} e^{px - K(p)t} H(p, y) dp \right)
= \mathcal{F}(x, y, t) + R(x, y, t),
\] where
\[
\mathcal{F}(x, y, t) = \frac{1}{2\pi i} D_1 t^{-(Q+1)/n} B(y) \int_{-\infty}^{\infty} e^{x_1 - a_n z^n} z^Q dz \\
= B(y) t^{-(Q+1)/n} \Lambda(x_1),
\]
\[
R(x, y, t) = \frac{1}{2\pi i} \left( \int_{-i}^{i} e^{px - a_n p^n t} O(p^{Q+1}(1 + y^{Q+1})) dp \\
+ \int_{-i}^{i} e^{px - a_n p^n t} (e^{-C p^{n t}} - 1) O(p^{Q}(1 + y^{Q+1})) dp \\
+ \int_{-\infty, |p| > 1}^{i\infty} e^{px - K(p)t} H(p, y) dp \right) = O(\langle y \rangle^{Q+1} t^{-(Q+2)/n}). \tag{4.19}
\]

We also note that for $t > 0$, $w \geq 0$, $k = 0, 1$, $r \geq 1$, $Q = n/2$,
\[
\| (\cdot)^{-(Q+1)/n} \partial_x^k \Lambda((\cdot)^{-1/n}) \|_{L^r} \leq C t^{-(Q+k-w)/n + (1/n)(1/r-1)}. \tag{4.20}
\]

In the same way, we can obtain asymptotic formula for the function $G_1$, which was defined in the introduction,
\[
G_1(s, q) = t^{-(Q+1)/n} y^Q \Lambda(x_1) O(\langle y \rangle^{Q+1} t^{-(Q+2)/n}),
\]
\[
A_j = \prod_{k=1, k \neq j}^{n/2} \frac{1 + r_k}{1 - r_k}, \quad a_n r_k^n = -1, \quad \text{Re} r_k > 0. \tag{4.21}
\]
5. Preliminaries

We introduce the operators

\[ \mathbb{G}_0(t)f = \int_0^{+\infty} G(x, y, t) f(y) dy, \quad (5.1) \]
\[ G(x, y, t) = F_1(x - y, t) + F_2(x, y, t), \quad (5.2) \]
\[ F_1(x, t) = \frac{1}{2\pi i} \int_{-\infty}^{+\infty} e^{px - K(p)t} dp, \quad (5.3) \]
\[ F_2(x, y, t) = \frac{1}{2\pi i} \sum_{j=1}^{N} \int_{-\infty}^{+\infty} e^{px - K(p)t} \frac{e^{-\phi_j(K(p))y} P_N(p)}{P_N'(\phi_j)(p - \phi_j)} dp, \quad (5.4) \]
\[ P_N(p) = \prod_{l=1}^{N} (p - \phi_l). \quad (5.5) \]

Also we denote

\[ G_0(s) = \frac{1}{2\pi i} \int_{-\infty}^{+\infty} e^{zs - a_n z^n} z^{n/2} dz, \quad D = \sqrt{\frac{\im a_m}{\im a_n}} \frac{1}{2(m-n)} > 0, \]
\[ \mathcal{G}_0(t) = t^{-1/n} \int_{\mathbb{R}^n} G_1(xt^{-1/n}, yt^{-1/n}) \phi(y) dy, \]
\[ G_1(s, q) = \frac{1}{2\pi i} \int_{-\infty}^{+\infty} e^{-a_n z^n} \left( e^{s-q} - \sum_{j=1}^{n/2} A_j e^{-(s+r_j q)} \right) dz, \quad (5.6) \]
\[ A_j = \prod_{k=1, k \neq j}^{n/2} \frac{1 + r_k}{1 - r_k}, \quad a_n r_k^n = -1, \quad \text{Re} r_k > 0, \]
\[ B(x) = \sum_{j=1}^{N-(n/2)} r_j^{N-n} \left( e^{-r_j x} - \sum_{l=0}^{n/2} (-1)^l \frac{(r_j x)^l}{l!} \right). \]

We first collect some preliminary estimates of the Green operator \( \mathbb{G}_0(t) \) in the norms \( \| \phi \|_{L^r} \) and \( \| \phi \|_{L^{1,r}} \), where \( a \in (0, Q+1) \), \( r = 1, \infty \). Everywhere below, the constants \( C > 0 \) depend only on the characteristics of the symbol \( K(p) \), that is, on the numbers \( n, m, a_n, \) and \( a_m \).

**Lemma 5.1.** Suppose that the function \( \phi \in \mathbb{L}^\infty \cap \mathbb{L}^{1,Q+1} \). Then the estimates

\[ \| \partial_k^p \mathbb{G}_0(t) \phi \|_{L^r} \leq C \{ t \}^{-k/m(t) - k/n - 1/n(1-1/r)} \left( \| \phi \|_{\mathbb{L}^{1,r}} + \| \phi \|_{\mathbb{L}^1} + \{ t \}^{-1/n} \| \phi \|_{\mathbb{L}^{1,1}} \right), \]
\[ \| (\cdot)^{\alpha} \partial^p_\alpha (\mathbb{G}_0(t) \phi - \theta t^{-(Q+1)/n} G_0(t^{-1/n}(\cdot))) \|_{L^r} \leq C \{ t \}^{-Q+1+k-w/n+1/n(1/r-1)} \{ t \}^{-(k-w)/m + (1/m)(1/r-1)} \| \phi \|_{\mathbb{L}^{1,Q+1}} \quad (5.7) \]
are valid for all \( t > 0 \), where

\[
1 \leq r \leq \infty, \quad 0 \leq \omega \leq Q + 1, \quad \theta = \int_0^{+\infty} x^Q \phi(x) dx, \quad k = 0, 1, Q = \frac{n}{2}.
\]

**Proof.** By symbol \( \mathcal{F}_{p-x} \), we denote inverse Fourier transformation. Note that the kernel \( F_1(x, t) = \mathcal{F}_{p-x}(e^{-K(p)t}) \) in representation (5.3) is a smooth function \( F_1(x, t) \in C^\infty(\mathbb{R}^1) \) and decays at infinity so that

\[
\sup_{x \in \mathbb{R}^1} \langle x(t)^{-1/m} \{t\}^{-1/m} \rangle^{2+k} \left| \partial_x^k F_1(x, t) \right| \leq C \langle t \rangle^{-(1+k)/n \{t\} - (1+k)/m}, \tag{5.9}
\]

for all \( k = 0, 1, 2 \). Indeed, we have

\[
\left| \partial_x^k F_1(x, t) \right| = \left| \mathcal{F}_{p-x}(p^k e^{-K(p)t}) \right| \leq C \left| p^k e^{-K(p)t} \right|_{L^1} \leq (t)^{-1/(n \{t\}) - (1+k)/m},
\]

\[
\left| x^{2+k} \partial_x^k F_1(x, t) \right| = \left| \mathcal{F}_{p-x}(\partial_p^k (p^k e^{-K(p)t})) \right| \leq C \left| \partial_p^k (p^k e^{-K(p)t}) \right|_{L^1}
\]

for \( k = 0, 1, 2 \). Since

\[
\left| \partial_p^k (p^k e^{-K(p)t}) \right| \leq C t \{p\}^{-n/2} \langle p \rangle^{m-2} e^{-\Re K(p)t} \tag{5.11}
\]

for all \( p \in \mathbb{R}, k = 0, 1, 2 \), we obtain

\[
\left| x^{2+k} \partial_x^k F_1(x, t) \right| \leq C(t)^{1/n \{t\}^{1/m}}. \tag{5.12}
\]

Therefore estimate (5.9) is true. By virtue of (5.9), we find

\[
\left| \partial_x^k F_1(\cdot, t) \right|_{L^1} \leq C(t)^{-(1+k)/n \{t\} - (1+k)/m} \left| \langle x(t)^{-1/m} \{t\}^{-1/m} \rangle^{2+k} \right|_{L^1} \leq C(t)^{-k/n \{t\} - k/m}. \tag{5.13}
\]

Therefore using the Young inequality from (5.9) and (5.13), we find

\[
\left| \int_0^{+\infty} \partial_x^k F_1(\cdot - y, t) \phi(y) dy \right|_{L^1} \leq C(t)^{-k/m \{t\} - k/n \{t\} - 1/m} (\|\phi\|_{L^\infty} + \|\phi\|_{L^1}). \tag{5.14}
\]

From (4.2), (4.4), and (4.5), we have

\[
\left| \sum_{j=1}^{N} \frac{e^{-\phi_j(K(p)) y N(p)} (p - \phi_j)}{P_N(\phi_j(K(p))) (p - \phi_j)} \right| < C, \quad |p| \leq 1, \tag{5.15}
\]

\[
\left| \sum_{j=1}^{N} \frac{e^{-\phi_j(K(p)) y N(p)} (p - \phi_j)}{P_N(\phi_j(K(p))) (p - \phi_j)} \right| < Ce^{-Cp}, \quad |p| > 1.
\]
Since we make the change of variable where Also taking Via (5.16), the estimates and imply that Therefore, we obtain

\[
\| \int_0^{+\infty} \partial_x^k F_2(\cdot, y, t) \phi(y) dy \|_{L^\infty} \leq C \| \phi \|_{L^1} \int_{-i}^i e^{-\text{Re}K(p)t} \| p \| |dp| \\
+ \int_{|p|>1, p \in \mathcal{C}_1} e^{-\text{Re}K(p)t} \| p \| |dp| \int_0^{C_y} dy e^{\text{Re}p(x-C_y)-\text{Re}K(p)t} \| \phi(y) \| \\
+ \int_{|p|>1, p \in \mathcal{C}_2} e^{-\text{Re}K(p)t} \| p \| |dp| \int_0^{+\infty} dy e^{\text{Re}p(x-C_y)-\text{Re}K(p)t} \| \phi(y) \|,
\]

where

\[
\mathcal{C}_1 = \left\{ p = \rho e^{\pm i\lambda_1} \mid \rho \geq 0, \lambda_1 = \frac{\pi}{2} + \epsilon, \text{Re}K(p) > 0, \epsilon > 0 \right\}, \\
\mathcal{C}_2 = \left\{ p = \rho e^{\pm i\lambda_1} \mid \rho \geq 0, \lambda_1 = \frac{\pi}{2} - \epsilon, \text{Re}K(p) > 0, \epsilon > 0 \right\}. 
\]

We make the change of variable \(|p|^n t = z\) to get

\[
\int_{-i}^i e^{-\text{Re}K(p)t} \| p \| |dp| \leq Ct^{-(k+1)/n}. \tag{5.18}
\]

Also taking \(|p|^m t = z\), we find

\[
\int_{|p|>1, p \in \mathcal{C}_1} e^{-\text{Re}K(p)t} \| p \| |dp| \int_0^{C_y} dy e^{\text{Re}p(x-C_y)} \| \phi(y) \| \\
+ \int_{|p|>1, p \in \mathcal{C}_2} e^{-\text{Re}K(p)t} \| p \| |dp| \int_0^{+\infty} dy e^{\text{Re}p(x-C_y)-\text{Re}K(p)t} \| \phi(y) \| \\
\leq C t^{-(k+1)/m} \int_0^{+\infty} e^{-C_1 t^{-1/m} |x-C_y|} \| \phi(y) \| |dy| \leq C t^{-k/m} \| \phi \|_{L^1}. \tag{5.19}
\]

Via (5.16), the estimates (5.18) and (5.19) imply that

\[
\left\| \int_0^{+\infty} \partial_x^k F_2(\cdot, y, t) \phi(y) dy \right\|_{L^\infty} \leq C \| \phi \|_{L^1} \tag{5.20}
\]

Since

\[
\frac{1}{2\pi i} \sum_{j=1}^N \int_{-i\infty}^{i\infty} \frac{e^{px-K(p)t} P_N(p)}{P_N(\phi_j)} \frac{dP}{(\phi_j)_j} \left( \phi - \phi_j \right) \left( p - \phi_j \right) \approx \frac{1}{2\pi i} \int_{-i\infty}^{+\infty} e^{px-K(p)t} \left| dp \right| = F_1(x, 0, t), \tag{5.21}
\]

we rewrite function \( F_2(x, y, t) \) in following form:

\[
F_2 = F_1(x, 0, t) + F_3(x, y, t). \tag{5.22}
\]
By virtue of (4.2)–(4.5), we have

$$\left| \sum_{j=1}^{N} (e^{-\phi_j(K(p))} y - 1) P_N(p) \right| < C \{p\} y + C. \quad (5.23)$$

So changing the contour of integration, we get

$$\left\| \partial_k F_3(\cdot, y, t) \right\|_{L^1} \leq C \left( \int_{|p|<1, \rho \in \mathcal{C}_1} |p|^k e^{-\text{Re}K(p)t} |dp| + \int_{|p|>1, \rho \in \mathcal{C}_1} |p|^{k-1} e^{-\text{Re}K(p)t} |dp| \right)$$

$$\leq \{t\}^{-k/m} \{t\}^{-(k+1)/n} y,$$  \((5.24)\)

where

$$\mathcal{C}_1 = \left\{ p = \rho e^{\pm i \lambda_1} \mid \rho \geq 0, \lambda_1 = \frac{\pi}{2} + \varepsilon, \text{Re}K(p) > 0, \varepsilon > 0 \right\}. \quad (5.25)$$

Therefore from (5.13) and (5.24), we get

$$\left\| \partial_k F_2(\cdot, y, t) \right\|_{L^1} < C \{t\}^{-k/m} \{t\}^{-(k+1)/n} y + \{t\}^{-k/m} \{t\}^{-k/n}. \quad (5.26)$$

Hence, it follows that

$$\left\| \int_0^{+\infty} \partial_k F_2(\cdot, y, t) \phi(y) dy \right\|_{L^1} \leq C \{t\}^{-k/m} \{t\}^{-k/n} \left( \|\phi\|_{L^1} + \langle t \rangle^{-k/n} \|\phi\|_{L^{1,1}} \right). \quad (5.27)$$

From (5.14), (5.20), (5.27), we obtain the first estimate of the lemma:

$$\left\| \partial_k G(t) \phi \right\|_{L^r} \leq C \{t\}^{-k/m} \{t\}^{-k/n-1/n(1-1/r)} \left( \|\phi\|_{L^\infty} + \|\phi\|_{L^1} + \langle t \rangle^{-1/n} \|\phi\|_{L^{1,1}} \right). \quad (5.28)$$

for all \( t > 0 \), where \( 1 \leq r \leq \infty \). Since by virtue of the estimate (4.18),

$$G(x, y, t) = t^{-(Q+1)/n} G_0(t^{-1/n}(\cdot)) B(y)$$

$$= \frac{1}{2\pi i} \left( \int_{|p|<1, \rho \in \mathcal{C}_1} e^{p x - a \rho p t} O(p^{Q+1}(1 + y^{Q+1})) |dp| + \int_{|p|<1, \rho \in \mathcal{C}_1} e^{p x - a \rho p t} (e^{-C p t} - 1) O(p^{Q}(1 + y^{Q+1})) |dp| \right)$$

$$+ \int_{|p|>1, p \in \mathcal{C}_1} e^{p x - K(p)t} H(p, y) |dp|, \quad (5.29)$$

$$H(p, y) < C, \quad |p| > 1, p \in \mathcal{C}_1.$$
we easily obtain

\[ \left\| \omega^{k} \partial_{x}^{k} \left( \mathbb{G}(t) \phi - \delta t^{-\frac{(Q+1)}{n}} G_{0}(t^{-\frac{1}{n}}(\cdot)) \right) \right\|_{L^{r}} \]

\[ \leq \left\{ y^{Q+1} \right\} \left\| \omega^{k} \int_{p \in \mathbb{C}, |p| < 1} e^{Re_{p}x - Re_{a}p^r t |p|^{Q+1+k}|dp|} \right\|_{L^{r}} \]

\[ + \left\| \omega^{k} \int_{p \in \mathbb{C}, |p| \geq 1} e^{Re_{p}x - K(p)t |p|^{k}|dp|} \right\|_{L^{r}} \]

\[ \leq \left\{ y^{Q+1} \right\} \int_{p \in \mathbb{C}, |p| < 1} e^{-Re_{a}p^r t |p|^{Q+1+k-w-1/r}|dp|} \]

\[ + \int_{p \in \mathbb{C}, |p| \geq 1} e^{-K(p)t |p|^{k-w-1/r}|dp|} \]

\[ \leq C(t)^{-\frac{(Q+1+k-w)}{n+1/m(1/r-1)}} \left\{ t \right\}^{-(k-w/m)+1/m(1/r-1)} \| \phi \|_{L^{r},Q+1} \]

for any \( \omega \in [0, Q+1] \). Thus the second estimate of the lemma follows. Lemma 5.1 is proved.

In the same way, we can prove the following.

**Lemma 5.2.** Suppose that the function \( \phi \in L^{\infty} \cap L^{1,Q+1} \). Then the estimates

\[ \left\| \omega^{k} \partial_{x}^{k} \left( \mathbb{G}(t) \phi - \theta t^{-\frac{(Q+1)}{n}} G_{0}(t^{-\frac{1}{n}}(\cdot)) \right) \right\|_{L^{r}} \]

\[ \leq C \left\{ t \right\}^{-k/m} \left\{ t \right\}^{-(Q+1)/n} \left\{ t \right\}^{-(1/1-r)} \left( \| \phi \|_{L^{\infty}} + \| \phi \|_{L^{1}} + \left\{ t \right\}^{-1/1-r} \| \phi \|_{L^{1,1}} \right) \]

\[ \left\| \omega^{k} \partial_{x}^{k} \left( \mathbb{G}(t) \phi - \theta t^{-\frac{(Q+1)}{n}} G_{0}(t^{-\frac{1}{n}}(\cdot)) \right) \right\|_{L^{r}} \]

\[ \leq C(t)^{-\frac{(Q+1+k-w)}{n+1/m(1/r-1)}} \left\{ t \right\}^{-(k-w/m)+1/m(1/r-1)} \| \phi \|_{L^{r},Q+1} \]

are valid for all \( t > 0 \), where

\[ 1 \leq r \leq \infty, \quad 0 \leq \omega \leq Q+1, \quad \theta = \int_{0}^{+\infty} x^{Q}\phi(x)dx, \quad k = 0, 1. \]

We introduce the function space for \( k = 0, 1 \),

\[ \| \phi \|_{X} = \sup_{t > 0} \left( \sum_{k=0}^{1} \left\{ t \right\}^{k/m} \left\{ t \right\}^{(Q+k)/n} \left\{ t \right\}^{-(1/1-r)} \| \partial_{x}^{k} \phi(t) \|_{L^{r}} + \left\{ t \right\}^{k/m} \left\{ t \right\}^{-(1/1-r)} \| \partial_{x}^{k} \phi(t) \|_{L^{r},Q+1} \right), \]

\[ \| \phi \|_{Y} = \sup_{t > 0} \left( \sum_{k=0}^{1} \left\{ t \right\}^{k/m} \left\{ t \right\}^{(Q+1)/n} \left\{ t \right\}^{-(1/1-r)} \| \phi(t) \|_{L^{r}} + \left\{ t \right\}^{-(1/1-r)} \| \phi(t) \|_{L^{r},Q+1} \right), \]

where \( \sigma \leq m \).
Lemma 5.3. Let the function \( f(x, t) \) satisfy \( \int_0^{+\infty} x^2 f(x, t) \, dx = 0 \). Then the inequality

\[
\left\| \int_0^t g_0(t - \tau) f(\tau) \, d\tau \right\|_X \leq C \| f \|_Y,
\]

(5.34)

\[
\left\| \langle t \rangle^{\gamma_2} \int_0^t (g(t - \tau) - g_0(t - \tau)) f(\tau) \, d\tau \right\|_X \leq C \| f(t) \|_Y, \quad \gamma_2 \in \left[0, 1 - \frac{\sigma}{m}\right),
\]

is valid for \( l = 0, 1 \), provided that the right-hand side is finite.

Proof. By Lemma 5.2, we get

\[
\left\| \int_0^t \partial_x^k g_0(t - \tau) f(\tau) \, d\tau \right\|_{L^\infty} + \left\| \int_0^t \partial_x^k g_0(t - \tau) f(\tau) \, d\tau \right\|_{L^{1,Q+1}} \leq C \| f(t) \|_Y \int_0^1 (1 + \tau)^{-1} \{ t \}^{-\sigma/m} \{ t - \tau \}^{-1/m} \, d\tau \leq C \| f(t) \|_Y
\]

for all \( 0 \leq t \leq 1 \). We now consider \( t > 1 \). By virtue of Lemma 5.2 with \( \omega = 0 \), we obtain

\[
\left\| \int_0^t \partial_x^k g_0(t - \tau) f(\tau) \, d\tau \right\|_{L^r} \leq C \int_0^{t/2} (t - \tau)^{-\left(Q + 1 + k\right)/r + (1/n)(1/r - 1)} \{ \tau \}^{-1 + 1/n} \{ t \}^{-\sigma/m} \, d\tau \| f(\tau) \|_{L^{1,Q+1}}
\]

\[
+ C \int_{t/2}^t (t - \tau)^{-k/n - (1-n)(1-1/r)} \{ \tau \}^{-Q/n - 1} \, d\tau \sup_{\tau > 0} \left( \| f(\tau) \|_{L^\infty} + \| f(\tau) \|_{L^1} \right)
\]

\[
+ C \int_{t/2}^t (t - \tau)^{-k/n - (1-n)(1-1/r)} \{ \tau \}^{-Q/n - 1 + 1/n(Q+1)} \, d\tau \sup_{\tau > 0} \| f(\tau) \|_{L^{1,1}}
\]

\[
\leq C \{ t \}^{-k/m} \| f \|_Y
\]

for \( 1 \leq r \leq \infty \), and using the second estimate of Lemma 5.2 with \( \omega = Q + 1 \), we get

\[
\left\| \int_0^t \partial_x^k g_0(t - \tau) f(\tau) \, d\tau \right\|_{L^{1,Q+1}} \leq C \int_0^{t/2} \{ \tau \}^{-\sigma/m} \{ t - \tau \}^{-1 + 1/n} \{ t - \tau \}^{(1/n)(1/r - 1 - k)} \, d\tau \| f(\tau) \|_{L^{1,Q+1}}
\]

(5.37)

\[
+ C \int_{t/2}^t \{ \tau \}^{-1 + 1/n} \{ t - \tau \}^{(1/n)(1/r - 1 - k)} \, d\tau \| f(\tau) \|_{L^{1,Q+1}}
\]

\[
\leq C \{ t \}^{-k/m} \| f \|_Y
\]

for all \( t > 1 \). Hence the result of the lemma follows. In the same way, we can prove second estimate of this lemma. Lemma 5.3 is proved. \( \square \)
6. Proof of Theorem 1.1

The local existence of solutions for the initial-boundary value problem (1.1) can be obtained by the standard contraction mapping principle (for the proof see [7]).

**Theorem 6.1.** Let the initial data $u_0 \in L^\infty \cap L^{1,n/2+1}$. Then for some $T > 0$, there exists a unique solution $u(t,x) \in C([0,T);L^\infty \cap L^{1,n/2+1}) \cap C((0,T);W^{1,0}_\infty \cap W^{1,n/2+1}_1)$ of the problem (1.1).

By the local existence theorem (Theorem 6.1), it follows that the global solution (if it exists) is unique. So our main purpose in the proof of Theorem 1.1 is to show the global-in-time existence of solutions.

We use Theorem 2.1 to prove Theorem 1.1. Denote

$$
\|g\|_Z = \left(\|g(t)\|_{L^\infty} + \|g(t)\|_{L^{1,n/2+1}}\right),
$$

and

$$
\|\phi\|_X = \sup_{t > 0} \left(\sum_{k=0}^1 \left\{t^{k/m}\langle t\rangle^{(Q+k)/(1-n)(1-1/r)}\|\partial_x^k \phi(t)\|_{L^r} + \{t\}^{k/m}\langle t\rangle^{(k-1)/n}\|\partial_x^k \phi(t)\|_{L^{1,Q+1}}\right\}\right),
$$

and

$$
\|\phi\|_Y = \sup_{t > 0} \left(\sum_{k=0}^1 \left\{t^{\sigma/m}\langle t\rangle^{Q/n+1+(1/n)(1-1/r)}\|\phi(t)\|_{L^r} + \{t\}^{\sigma/m}\langle t\rangle^{1-1/n}\|\phi(t)\|_{L^{1,Q+1}}\right\}\right).
$$

From Lemmas 5.1 and 5.2, we easily get the following estimates:

$$
\left\|\langle t\rangle^\gamma (\mathcal{G}(t) - \mathcal{G}_0(t))\phi\right\|_X \leq C\|\phi\|_Z,
$$

where $\gamma = \min((1/2)\mu, 1 - \sigma/m)$. From Lemma 5.3, we have that if $\int_{\mathbb{R}} x^Q f dx = 0$,

$$
\left\|\int_0^t \mathcal{G}_0(t-\tau)f(\tau)d\tau\right\|_X \leq C\|f(t)\|_Y, \quad \nu \in \left[0, 1 - \frac{\sigma}{m}\right],
$$

$$
\left\|\langle t\rangle^{\gamma} \int_0^t (\mathcal{G}(t-\tau) - \mathcal{G}_0(t-\tau)) f(\tau)d\tau\right\|_X \leq C\|f(t)\|_Y.
$$

Also by direct calculation, we have

$$
\|\langle N(u_1) - N(u_2)\rangle\|_Y \leq C\|(u_1 - u_2)\|_X \left(\|u_1\|^{\sigma\rho-1}_X + \|u_2\|^{\sigma\rho-1}_X\right),
$$

$$
\|t^{-Q+1/n} V((\cdot)t^{-1/n})\|_X \leq C\|V(\cdot)\|_W.
$$
where
\[ \| \phi \|_W = \sup_{t > 0} (\| \phi(t) \|_{L^r} + \| \phi(t) \|_{L^{1+Q}}). \] (6.7)

Therefore from Theorem 2.1 with \( \beta = 1/n \), \( \alpha = (n + 2)/2n \), and
\[ G_0(s) = \frac{1}{2\pi i} \int_{-\infty}^{\infty} e^{zs-a_n z^Q} dz, \quad D = \frac{1}{\sqrt{i^n a_n}} \frac{1}{2(m-n)} > 0, \] (6.8)

we get the result of Theorem 1.1. This completes the proof of Theorem 1.1.

Special Issue on
Decision Support for Intermodal Transport

Call for Papers

Intermodal transport refers to the movement of goods in a single loading unit which uses successive various modes of transport (road, rail, water) without handling the goods during mode transfers. Intermodal transport has become an important policy issue, mainly because it is considered to be one of the means to lower the congestion caused by single-mode road transport and to be more environmentally friendly than the single-mode road transport. Both considerations have been followed by an increase in attention toward intermodal freight transportation research.

Various intermodal freight transport decision problems are in demand of mathematical models of supporting them. As the intermodal transport system is more complex than a single-mode system, this fact offers interesting and challenging opportunities to modelers in applied mathematics. This special issue aims to fill in some gaps in the research agenda of decision-making in intermodal transport.

The mathematical models may be of the optimization type or of the evaluation type to gain an insight in intermodal operations. The mathematical models aim to support decisions on the strategic, tactical, and operational levels. The decision-makers belong to the various players in the intermodal transport world, namely, drayage operators, terminal operators, network operators, or intermodal operators.

Topics of relevance to this type of decision-making both in time horizon as in terms of operators are:

- Intermodal terminal design
- Infrastructure network configuration
- Location of terminals
- Cooperation between drayage companies
- Allocation of shippers/receivers to a terminal
- Pricing strategies
- Capacity levels of equipment and labour
- Operational routines and lay-out structure
- Redistribution of load units, railcars, barges, and so forth
- Scheduling of trips or jobs
- Allocation of capacity to jobs
- Loading orders
- Selection of routing and service

Before submission authors should carefully read over the journal’s Author Guidelines, which are located at http://www.hindawi.com/journals/jamds/guidelines.html. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/, according to the following timetable:
