Comparison of KP and BBM-KP Models

Gideon P. Daspan and Michael M. Tom

Received 26 January 2007; Accepted 17 May 2007

Recommended by Nils Ackermann

It is shown that the solutions of the pure initial-value problem for the KP and regularized KP equations are the same, within the order of accuracy attributable to either, on the time scale \(0 \leq t \leq \epsilon^{-3/2}\), during which nonlinear and dispersive effects may accumulate to make an order-one relative difference to the wave profiles.

1. Introduction

Bona et al. [1] compared the solutions of the Cauchy problem of the Korteweg-de Vries (KdV)

\[ P_t + P_x + PP_x + P_{xxx} = 0 \]  

(1.1)

and the Benjamin-Bona-Mahony (BBM) equation

\[ Q_t + Q_x + QQ_x - Q_{xxt} = 0. \]  

(1.2)

In (1.1) and (1.2), \(P\) and \(Q\) are functions of two real variables \(x\) and \(t\).

Such equations have been derived as models for nonlinear dispersive waves in many different physical contexts, and in most cases where they arise, \(x\) is proportional to distance measured in the direction of wave propagation, while \(t\) is proportional to elapsed time. Interest is often focused on the pure initial-value problem for (1.1) and (1.2) in which \(P\) and \(Q\) are specified for all real \(x\) at some beginning value of \(t\), say \(t = 0\), and then the evolution equation is solved for \(t \geq 0\) subject to the restriction that the solution respects the given initial condition. The thrust of their theory was that for suitably restricted
initial conditions, the solutions \( P \) and \( Q \) emanating therefrom are nearly identical at least for values of \( t \) in an interval \([0, T]\), where \( T \) is quite large.

This paper is concerned with mathematical models representing the unidirectional propagation of weakly nonlinear dispersive long waves with weak transverse effects. Interest will be directed toward two particular models. One is the Kadomtsev-Petviashvili (KP) equations

\[
\left( \eta_t + \eta_x + \eta \eta_x + \eta_{xxx} \right)_x + a \eta_{yy} = 0
\]

(1.3)

and the other is a regularized version, the Benjamin-Bona-Mahony (BBM-KP) equation

\[
\left( \xi_t + \xi_x + \xi \xi_x - \xi_{xxt} \right)_x + a \xi_{yy} = 0,
\]

(1.4)

where \( a = \pm 1 \). If \( a = +1 \) in (1.3), the equation is known as the KP II equation, while for \( a = -1 \), it is the KP I equation. The Kadomtsev-Petviashvili equations are two-dimensional extensions of the Korteweg-de-Vries equation. They occur naturally in many physical contexts as “universal” models for the propagation of weakly nonlinear dispersive long waves which are essentially one directional, with weak transverse effects. Observe that the linearized dispersion relation for (1.3) is

\[
w(k, l) = k \left( 1 - k^2 + \frac{\alpha l^2}{k^2} \right),
\]

(1.5)

while that of (1.4) is

\[
\tilde{w}(k, l) = \frac{k^2 + \alpha l^2}{k(1 + k^2)},
\]

(1.6)

within the scaling assumption that \( k^2 = O(\delta) \), and \( l = O(\delta) \). As \( \delta \to 0 \), \( w(k, l) \) may be approximated by \( \tilde{w}(k, l) \) to the same order of \( \delta \) (since \( k^2l^2 \) is of higher order).

The Cauchy problem for these equations have been studied by a number of authors. Bourgain [2], using Picard iteration, has proved that the pure initial-value problem for the KP II equation is locally well-posed, and hence in light of the conservation laws for the equation, globally well-posed for data in \( L^2(\mathbb{R}) \). The same method has been used to extend local well-posedness to some Sobolev spaces of negative indices.

A compactness method that uses only the divergence form of the nonlinearity and the skew-adjointness of the linear dispersion operator was employed by Iório and Nunes in [3] to establish local well-posedness for data in \( H^s(\mathbb{R}^2) \), for \( s > 2 \), for the KP I equation. The Iório-Nunes approach applies equally well to KP II-type equation. Molinet et al. [4] using the local well-posedness of Iório and Nunes obtained a version of the classical energy method coupled with some of the known conserved quantities and delicate estimates of Strichartz type for the KP I equation to show global well-posedness for KP I equation in the space

\[
Z = \left\{ \varphi \in L^2(\mathbb{R}^2) : \| \varphi \|_{L^2} + \| \varphi_{xxx} \|_{L^2} + \| \varphi_y \|_{L^2} + \| \varphi_{xy} \|_{L^2} + \| \varphi_{xxx} \|_{L^2} + \| \varphi_{x}^{1/2} \varphi_y \|_{L^2} + \| \varphi_x^{1/2} \varphi_{yy} \|_{L^2} < \infty \right\}.
\]

(1.7)
Kenig [5] improved on this local well-posedness result given by the classical energy estimate by showing local well-posedness in the space

\[ Y_s = \left\{ \phi \in L^2(\mathbb{R}^2) : \|\phi\|_{L^2} + \|\mathcal{F}^s \phi\|_{L^2} + \|\partial^{-1}_x \phi_y\|_{L^2} < \infty \right\} \]  

(1.8)

for \( s > 3/2 \), where \( \mathcal{F}^s f(k,l) = (1 + k^2)^{s/2} \mathcal{F}(k,l) \).

In [6], global well-posedness is established in

\[ Z_0 = \left\{ \phi \in L^2(\mathbb{R}^2) : \|\phi\|_{L^2} + \|\partial^{-1}_x \phi_y\|_{L^2} + \|\partial^{-1}_x \partial^{-1}_y \phi\|_{L^2} < \infty \right\} \]  

(1.9)

for the KP I equation. It is worth mentioning the result of Colliander et al. [7], dealing with the well-posedness of KP I equation when the initial data has low regularity. Bona et al. [8] have shown that (1.4) can be solved by Picard iteration yielding to local and global well-posedness results for the associated Cauchy problem. In particular, it is shown that the pure initial-value problem for (1.4), regardless of the sign of \( \alpha \), is globally well-posed in

\[ W_1 = \left\{ \phi \in L^2(\mathbb{R}^2) : \|\phi\|_{L^2} + \|\phi_x\|_{L^2} + \|\partial^{-1}_x \phi_y\|_{L^2} + \|\phi_y\|_{L^2} < \infty \right\}. \]  

(1.10)

Saut and Tzvetkov [9] improved this global well-posedness to the space

\[ Y = \left\{ \phi \in L^2(\mathbb{R}^2) : \phi_x \in L^2(\mathbb{R}^2) \right\}. \]  

(1.11)

We remark that provided \( g \) satisfies an appropriate constraint, (1.3) and (1.4) are equivalent to the integrated forms

\[ \eta_t + \eta_x + \eta \eta_x + \eta_{xxx} + \alpha \partial^{-1}_x \eta_{yy} = 0, \]  

\[ \xi_t + \xi_x + \xi \xi_x - \xi_{xxx} + \alpha \partial^{-1}_x \xi_{yy} = 0. \]  

(1.12)

To illustrate the kind of results we have in mind, we briefly outline below what Saut and Tzvetkov generally discussed concerning the relationship between the two models in [9]. Since both KP and BBM-KP equations model weakly nonlinear dispersive long waves which are valid to order \( \epsilon^2 \), they can be considered as order \( \epsilon \) perturbations of the linear transport equation, and hence can be written as

\[ \eta_{\epsilon t} + \eta_{\epsilon x} + \epsilon \left( \eta_{\epsilon \epsilon x} + \eta_{\epsilon xxx} \pm \partial^{-1}_x \eta_{\epsilon yy} \right) = 0, \]  

\[ \xi_{\epsilon t} + \xi_{\epsilon x} + \epsilon \left( \xi_{\epsilon \epsilon x} - \xi_{\epsilon xxx} \pm \partial^{-1}_x \xi_{\epsilon yy} \right) = 0. \]  

(1.13)

(1.14)
with initial data $\eta_{\epsilon_0}, \xi_{\epsilon_0}$, respectively, which are of order one. The neglected terms in the right-hand sides of (1.13) and (1.14) are of order $\epsilon^2$. After performing the change of variables

$$M = \epsilon \eta, \quad N = \epsilon \xi, \quad x_1 = \epsilon^{-1/2} x, \quad y_1 = \epsilon^{-1} y, \quad \tau = \epsilon^{-1/2} t,$$

one can rewrite (1.12) and (1.13) as

$$M_\tau + M_{x_1} + MM_{x_1} + M_{x_1,x_1} \pm \partial_{x_1}^{-1} M_{y_1,y_1} = 0,$$

$$N_\tau + N_{x_1} + NN_{x_1} - N_{x_1,x_1} \tau \pm \partial_{x_1}^{-1} N_{y_1,y_1} = 0,$$

with initial data, respectively,

$$M(x_1,y_1,0) = \epsilon \eta_{\epsilon_0}(\epsilon^{1/2}x_1, \epsilon y_1),$$

$$N(x_1,y_1,0) = \epsilon \xi_{\epsilon_0}(\epsilon^{1/2}x_1, \epsilon y_1).$$

(1.15)

The dispersive and nonlinear terms in (1.13) and (1.14) may have a significant influence on the structure of the waves on the time scale $t_1 = \epsilon^{-1}$ (corresponding to $\tau_1 = \epsilon^{-3/2}$), while the neglected order $\epsilon^2$ terms might affect the solution at order one on time scale $t_2 = \epsilon^{-2}$ ($\tau_2 = \epsilon^{-5/2}$). It is therefore of interest to compare the solutions of (1.13) and (1.14) on time scales between $t_1$, and $t_2$. Such analysis was performed for the KdV and BBM models in [1].

To give an idea of the results one can expect that we consider the Cauchy problem for the linear versions of (1.13) and (1.14)

$$\eta_{\epsilon t} + \eta_{\epsilon x} + \epsilon (- \eta_{\epsilon xxx} \pm \partial_x^{-1} \eta_{\epsilon yy}) = 0,$$

$$\xi_{\epsilon t} + \xi_{\epsilon x} + \epsilon (- \xi_{\epsilon xxt} \pm \partial_x^{-1} \xi_{\epsilon yy}) = 0,$$

(1.16)

(1.18)

together with initial condition

$$\eta_{\epsilon}(x,y,0) = \xi_{\epsilon}(x,y,0) = f(x,y),$$

(1.19)

where $f$ is of order one. Taking the Fourier transforms in both $x$ and $y$ variables, we have

$$\hat{\eta}_{\epsilon t} + ik \hat{\eta}_{\epsilon} + \epsilon \left[ (ik)^3 \hat{\eta}_{\epsilon} \pm \frac{-l^2}{ik} \hat{\eta}_{\epsilon} \right] = 0,$$

$$\hat{\xi}_{\epsilon t} + ik \hat{\xi}_{\epsilon} + \epsilon \left[ k^2 \hat{\xi}_{\epsilon t} \pm \frac{il^2}{k} \hat{\xi}_{\epsilon} \right] = 0,$$

(1.20)
with \( \hat{\eta}_e(k,l,0) = \hat{\xi}_e(k,l,0) = \hat{f}(k,l) \). Solving for \( \eta_e \) and \( \xi_e \), there obtains

\[
\begin{align*}
\hat{\eta}_e &= e^{-it[k - \epsilon k^3]} \hat{f}(k,l,t), \\
\hat{\xi}_e &= e^{(-it)/(1+\epsilon k^2)}(k \pm \epsilon (l^2/k)) \hat{f}(k,l,t).
\end{align*}
\] (1.21)

It is readily inferred that provided \( k^5 \hat{f}(k,l), l^2 k \hat{f}(k,l) \in L^1(\mathbb{R}^2) \), then

\[
|\eta_e(\cdot,\cdot,t) - \xi_e(\cdot,\cdot,t)|_\infty \leq |\hat{\eta}_e(k,l,t) - \hat{\xi}_e(k,l,t)|_{L^1(\mathbb{R}^2)} \leq \epsilon^2 t C_f \leq C
\] (1.22)

since \( \eta_e \) and \( \xi_e \) are of order one, the estimate (1.22) proves that up to time scale \( t_1 = e^{-\left(1+\delta\right)} \), \( 0 < \delta < 1 \), \( \eta_e \) and \( \xi_e \) are \( \epsilon^{1-\delta} \) close to each other.

2. Notations

We will employ the following notations. We will let \( |\cdot|_p \) and \( \|\cdot\|_s \) denote the norms in \( L^p(\mathbb{R}^2) \) and the classical Sobolev spaces \( H^s(\mathbb{R}^2) \), respectively, where

\[
\|f\|_s^2 = \int_{\mathbb{R}^2} (1 + k^2 + l^2)^s \left| \hat{f}(k,l) \right|^2 dk dl
\] (2.1)

and \( \hat{\cdot} \) connotes Fourier transformation. Thus, the norm in \( L^2(\mathbb{R}^2) \) will simply be denoted by \( \|\cdot\|_0 \). By \( H^\infty \), we denote \( \cap_{s\geq0} H^s \). The elements of \( H^\infty \) are infinitely differentiable functions, all of whose derivatives lie in \( L^2 \). If \( X \) is an arbitrary Banach space and \( T > 0 \), the space \( C(0,T;X) \) is the collection of continuous functions \( u : [0,T] \to X \). This collection is a Banach space with the norm \( \sup_{0 \leq t \leq T} \| u(t) \|_X \), where \( \|\cdot\|_X \) denotes the norm in \( X \).

Define the space \( H_{-1}^s(\mathbb{R}^2) = \{ \eta \in S'(\mathbb{R}^2) : \| \eta \|_{H_{-1}^s(\mathbb{R}^2)} < \infty \} \) equipped with the norm

\[
\|\eta\|_{H_{-1}^s(\mathbb{R}^2)} = \left( \int_{\mathbb{R}^2} (1 + |k|^{-1})^2 (1 + k^2 + l^2)^s \left| \hat{\eta}(k,l) \right|^2 dk dl \right)^{1/2}. \] (2.2)

3. Summary of existence theory

As earlier mentioned, the pure initial-value problems for these model evolution equations have been studied. For our analysis, we will use the result of [6] for the Cauchy problem for KP I equation, and the result for the well-posedness of BBM-KP I equation is contained in [8].

We will first consider the initial-value problems for the KP I and BBM-KP I equations

\[
\begin{align*}
(\eta_t + \eta_x + \eta\eta_x + \eta_{xxx})_x - \eta_{yy} &= 0, \quad (3.1) \\
(\xi_t + \xi_x + \xi\xi_x - \xi_{xxx})_x - \xi_{yy} &= 0, \quad (3.2)
\end{align*}
\]
with initial condition

$$\eta(x,y,0) = \xi(x,y,0) = g(x,y).$$  \hspace{1cm} (3.3)

The theoretical results relating to the initial-value problems (3.1) and (3.2) are presented in the following theorems without proof.

**Theorem 3.1.** Let $s \geq 2$. Then for any $g \in H^s(\mathbb{R}^2)$, there exist a positive $T_0 = T_0(\nabla g_\infty)$ ($\lim_{\rho \to 0} T_0(\rho) = \infty$) and a unique $\eta$ of the integrated KP I equation (3.1) with initial data $g$ on the time interval $[0, T_0]$ satisfying $\eta \in C([0, T_0]; H^{s-1}(\mathbb{R}^2))$, $\eta_t \in C([0, T_0]; H^{s-3}(\mathbb{R}^2))$.

Furthermore, the map $g \mapsto \eta$ is continuous from $H^s(\mathbb{R}^2)$ to $C([0, T_0]; H^{s-1}(\mathbb{R}^2))$.

**Theorem 3.2.** Let $g \in H^s(\mathbb{R}^2)$ with $s > 3/2$. Then, there exist $T_0 > 0$ such that the BBM-KP I equation (3.2) has a unique solution $\xi \in C([0, T_0]; H^{s-1}(\mathbb{R}^2))$, $\partial_x^{-1} \xi_y \in C([0, T_0]; H^{-1}_x(\mathbb{R}^2))$, with $\xi_t \in C([0, T_0]; H^{s-2}(\mathbb{R}^2))$. Moreover, the map $g \mapsto \xi$ is continuous from $H^s(\mathbb{R}^2)$ to $C([0, T_0]; H^{s-1}(\mathbb{R}^2))$.

4. **Main result**

In this section, we compare the solutions of the initial-value problems

$$\eta_t + \eta_x + \eta \eta_x + \eta_{xxx} - \partial_x^{-1} \eta_{yy} = 0,$$

$$\xi_t + \xi_x + \xi \xi_x - \xi_{xxt} - \partial_x^{-1} \xi_{yy} = 0$$  \hspace{1cm} (4.1)

both with initial condition

$$\eta(x,y,0) = \xi(x,y,0) = \epsilon g(\epsilon^{1/2} x, \epsilon y).$$  \hspace{1cm} (4.2)

Our main result in this paper is the following.

**Theorem 4.1.** Let $g \in H^{k+5}_{-1}(\mathbb{R}^2)$, where $k \geq 0$ and let $\eta$ and $\xi$ be the unique solutions guaranteed by Theorems 3.1 and 3.2 for the initial-value problems (4.1). Then there exist positive constants $C$ and $T$ which depend only on $k$ and $g$ such that the solutions $\eta$ and $\xi$ of the initial-value problems

$$\eta_t + \eta_x + \eta \eta_x + \eta_{xxx} - \partial_x^{-1} \eta_{yy} = 0,$$

$$\xi_t + \xi_x + \xi \xi_x - \xi_{xxt} - \partial_x^{-1} \xi_{yy} = 0$$  \hspace{1cm} (4.3)

$$\eta(x,y,0) = \xi(x,y,0) = \epsilon g(\epsilon^{1/2} x, \epsilon y),$$
satisfy the inequalities

\[ \| \partial^j_x \eta(\cdot, \cdot, t) - \partial^j_x \xi(\cdot, \cdot, t) \|_0 \leq C \epsilon^{j/2 + 5/4}, \]

\[ \| \partial^j_x y \eta(\cdot, \cdot, t) - \partial^j_x y \xi(\cdot, \cdot, t) \|_0 \leq C \epsilon^{j} + 5/4 \]  

(4.4)

for \( 0 < \epsilon \leq 1 \), and \( 0 \leq t \leq \epsilon^{-\frac{3}{2}} \min\{ T, T_0 \} \), where \( 0 \leq j \leq k \).

Before we prove Theorem 4.1, we introduce two new dependent variables

\[ u(x, y, t) = \epsilon^{-1} \eta(\epsilon^{-1/2} x + \epsilon^{-3/2} t, \epsilon^{-1} y, \epsilon^{-3/2} t), \]

\[ v(x, y, t) = \epsilon^{-1} \xi(\epsilon^{-1/2} x + \epsilon^{-3/2} t, \epsilon^{-1} y, \epsilon^{-3/2} t). \]

(4.5)

A brief calculation shows that \( u \) and \( v \) satisfy, respectively, the initial-value problems

\[ u_t + uu_x + u_{xxx} - \partial_x^{-1} u_{yy} = 0, \]

\[ v_t + vv_x + v_{xxx} - \epsilon v_{xxt} - \partial_x^{-1} v_{yy} = 0, \]

\[ u(x, y, 0) = v(x, y, 0) = g(x, y). \]

(4.6)

By virtue of Theorems 3.1 and 3.2, the existence and uniqueness of \( u \) and \( v \) are assured.

**Theorem 4.2.** Let \( g \in H^s(R^2) \), where \( s \geq 2 \), then the initial-value problem for both equations (4.6) have solutions in \( C([0, T_0]; H^s(R^2)) \) for some \( T_0 > 0 \). Moreover, if \( g \in H^{k+5}_1(R^2) \), then there exist positive constants \( C \) and \( T \) depending only on \( k \) and \( g \) such that the difference \( u - v \) satisfies

\[ \| \partial^j_x u - \partial^j_x v \|_0 \leq C \epsilon t, \]

\[ \| \partial^j_y u - \partial^j_y v \|_0 \leq C \epsilon t \]

(4.7)

for all \( \epsilon \) and \( t \) for which \( 0 \leq \epsilon \leq t \) and \( 0 \leq t \leq \min\{ T; T_0 \} \) where \( 0 \leq j \leq k \).

We will make use of the following anisotropic Sobolev inequalities

\[ |f|_\infty \leq 2 \| f \|_0^{1/4} \| f_x \|_0^{1/2} \| f_{xx} \|_0^{1/4}, \]

\[ |f_x|_\infty \leq \| f_{xx} \|_0^{1/4} \| f_y \|_0^{1/2} \| f_{xxy} \|_0^{1/4}, \]

(4.8)

the proofs of which can be found in [10].
Proof of Theorem 4.2. Let \( w = u - v \). Then, \( w \) is seen to satisfy

\[
\frac{\partial}{\partial t}w + w w_x + w_{xxx} - \epsilon w_{xxt} - \partial_x^{-1}w_{yy} = -\epsilon u_{xxt} - (wu)_x, \tag{4.9}
\]

\[
w(x,y,0) = 0. \tag{4.10}
\]

We now venture into the task of estimating \( \|\partial^j_x w\|_0 + \|\partial^j_y w\|_0 \), for \( j = 0,1,2,3,4, \ldots \).

In light of Theorem 3.1, we note that

\[
\|u\|_k \leq c \|g\|_{H^k(R^2)} = A_k. \tag{4.11}
\]

This fact justifies the following computations.

We first estimate \( \|\partial^j_x w\|_0 \). Apply the operator \( \partial^j_x \) to both sides of the differential equation (4.10), multiply the result by \( \partial^j_x w \), and integrate the result over \( R^2 \) and over \([0,t]\). After a few integrations by parts, and taking into account the fact that \( w(x,y,0) \equiv 0 \), it follows that

\[
\int_{R^2} \{(\partial^j_x w)^2 + \epsilon (\partial^{j+1}_x w)^2\} \, dx \, dy = 2 \int_0^t \int_{R^2} \partial^j_x w \left\{ \epsilon \partial^{j+2}_x u_{\tau} - \partial_x^{(j+1)} \left( wu + \frac{1}{2}w^2 \right) \right\} \, dx \, dy \, d\tau, \tag{4.12}
\]

which holds for \( j = 0,1,2, \ldots \). Similarly, apply the operator \( \partial^j_y \) on (4.10), multiply the result by \( \partial^j_y w \), and integrate the result over \( R^2 \) and over \([0,t]\). After a few integrations by parts, and taking into account the fact that \( w(x,y,0) \equiv 0 \), it follows also that

\[
\int_{R^2} \{(\partial^j_y w)^2 + \epsilon (\partial^{j+1}_y w)^2\} \, dx \, dy = 2 \int_0^t \int_{R^2} \partial^j_y w \left\{ \epsilon \partial^{j+2}_y u_{\tau} - \partial_y^{(j+1)} \left( wu + \frac{1}{2}w^2 \right) \right\} \, dx \, dy \, d\tau \tag{4.13}
\]

for \( j = 0,1,2,3,4, \ldots \). The relations (4.12) and (4.13) will be used repeatedly.

First, for \( j = 0 \), (4.12) or (4.13) may be used, since they will both given the same estimate. Making use of (4.12), there appears after two integrations by parts that

\[
\int_{R^2} (w^2 + \epsilon w_x^2) \, dx \, dy = \int_0^t \int_{R^2} \{2\epsilon (wu_{x\tau}) - (u_x^2) w^2\} \, dx \, dy \, d\tau, \tag{4.14}
\]

from this, the following inequality is derived

\[
\|w\|_0^2 \leq \int_0^t (2\epsilon \|w\|_0 \|u_{x\tau}\|_0 + \|u_x\|_\infty \|w\|_0^2) \, d\tau. \tag{4.15}
\]
By a variant of Gronwall’s lemma, it follows that

$$
\|w\|_0 \leq \epsilon \left( \frac{C_2}{C_1} \right) (e^{C_1 t} - 1) \leq \epsilon t C_2 e^{C_1 t} = M_0 \epsilon t,
$$

(4.16)

where $C_1$ and $C_2$ are bounds for $(1/2)\|u_x\|_\infty$ and $\|u_{xxx}\|_0$, respectively, and $t$ is restricted to the range $[0,1]$.

Using the equation satisfied by $u$, the following estimates can be derived:

$$
\sup_{t \geq 0} \|u_{xxx}\|_0 = \sup_{t \geq 0} \|u_{xyy} - 3u_x u_{xx} - uu_{xxx} - u_{xxxxxxx}\|_0 
\leq \sup_{t \geq 0} \left[ \|u_{xyy}\|_0 + 2\|u\|_0^{1/2}\|u_y\|_0^{1/2}\|u_x\|_0^{1/2}\|u_{xxx}\|_0^{1/4} + \|u_{xxxxx}\|_0 \right].
$$

(4.17)

Hence, $C_2$ may be defined by $\sup_{t \geq 0} \|u_{xxx}\|_0 \leq C_2$. For $C_1$, we estimate it from the anisotropic Sobolev inequality

$$
\|u_x\|_\infty \leq 2\|u_{xx}\|_0^{1/4}\|u_y\|_0^{1/2}\|u_{xxxx}\|_0^{1/4} \leq C_1.
$$

(4.18)

We therefore infer by an application of Gronwall’s lemma that

$$
\|w\|_0 \leq \epsilon \left( \frac{C_2}{C_1} \right) (e^{C_1 t} - 1) \leq \epsilon t C_2 e^{C_1 t} = M_0 \epsilon t \leq B
$$

(4.19)

for $0 \leq t \leq 1$.

For $j = 1$, integrate (4.12) by parts to get the following relation:

$$
\int_{\mathbb{R}^2} \left[ w_x^2 + \epsilon w_{xx}^2 \right] dx dy = \int_0^t \int_{\mathbb{R}^2} \left( 2\epsilon w_x u_{xxx} - w_x^3 - 3w_x^2 u_x - w_x w_{xxx} \right) dx dy d\tau.
$$

(4.20)

Similarly, for $j = 1$, integrate (4.13) by parts to get

$$
\int_{\mathbb{R}^2} \left[ w_y^2 + \epsilon w_{xy}^2 \right] dx dy = \int_0^t \int_{\mathbb{R}^2} \left( 2\epsilon w_y u_{xyy} - 2w_x w_y u_y + w_y^2 u_x + w_y w_{xy} - w_y^2 w_x \right) dx dy d\tau.
$$

(4.21)

Adding these two equations above, we obtain

$$
\int_{\mathbb{R}^2} \left[ w_x^2 + w_y^2 + \epsilon w_{xx}^2 + \epsilon w_{xy}^2 \right] dx dy
$$

$$
= \int_0^t \int_{\mathbb{R}^2} \left[ 2\epsilon w_x u_{xxx} - w_x^3 - 3w_x^2 u_x - w_x w_{xxx} + 2\epsilon w_y u_{xyy} 
+ 2w_x w_y u_y + w_y^2 u_x + w_y w_{xy} - w_y^2 w_x \right] dx dy d\tau.
$$

(4.22)
The integrand on the right-hand side of (4.22) may be bounded above by

\[ 2\epsilon \|w_x\|_0 \|u_{xxxr}\|_0 + 2\epsilon \|w_y\|_0 \|u_{xxyr}\|_0 + [4 |u_x|_\infty + |v_x|_\infty] \|w_x\|^2_0 
+ [2 |u_x|_\infty + |v_x|_\infty] \|w_y\|^2_0 + \|w_x\|_0 \|w\|_0 \|u_{xx}\|_\infty + \|w_y\|_0 \|w\|_0 \|u_{xy}\|_\infty 
+ 2\|w_x\|_0 \|w_y\|_0 \|u_y\|_\infty. \] (4.23)

Also from the anisotropic Sobolev inequalities, we infer that

\[ |u_y|_\infty \leq 2\|u_y\|_0^{1/4} \|u_{yy}\|_0^{1/2} \|u_{xxy}\|_0^{1/4} \leq C, \]
\[ |u_x|_\infty \leq 2\|u_x\|_0^{1/4} \|u_y\|_0^{1/2} \|u_{xxx}\|_0^{1/4} \leq C, \] (4.24)
\[ |u_{xx}|_\infty \leq 2\|u_{xxx}\|_0^{1/4} \|u_{xy}\|_0^{1/2} \|u_{xxxx}\|_0^{1/4} \leq C, \]
\[ |u_{xy}|_\infty \leq 2\|u_{xxy}\|_0^{1/4} \|u_{yy}\|_0^{1/2} \|u_{xxxxy}\|_0^{1/4} \leq C. \]

Now using the equation satisfied by \( u \), we may derive the following estimates, valid for \( 0 \leq \tau \leq 1 \):

\[ \sup_{t \geq 0} \|u_{xxxr}\|_0 \]
\[ \leq \sup_{t \geq 0} \left[ \|u_{xxy}\|_0 + 2\|u\|_0^{1/4} \|u_y\|_0^{1/2} \|u_{xx}\|_0^{1/4} \|u_{xxx}\|_0 
+ 8\|u_{xx}\|_0^{1/4} \|u_y\|_0^{1/2} \|u_{xxxx}\|_0^{1/4} \|u_{xxx}\|_0 + 3\|u_{xx}\|_0^2 + \|u_{xxxxxx}\|_0 \right] \leq C, \]

\[ \sup_{t \geq 0} \|u_{xxyr}\|_0 \]
\[ \leq \sup_{t \geq 0} \left[ \|u_{xxy}\|_0 + 4\|u_{xy}\|_0^{3/2} \|u_{xx}\|_0^{1/4} \|u_{xxx}\|_0^{1/4} 
+ 6\|u_{xx}\|_0^{1/4} \|u_y\|_0^{1/2} \|u_{xxx}\|_0^{1/4} \|u_{xxy}\|_0 + 2\|u_{yy}\|_0^{1/2} \|u_{xy}\|_0^{1/4} \|u_{xxx}\|_0^{1/4} \|u_{xxx}\|_0 
+ 2\|u_{x}\|_0^{1/4} \|u_y\|_0^{1/2} \|u_{xx}\|_0^{1/4} \|u_{xxy}\|_0 + \|u_{xxxxx}\|_0 + \|u_{yyyy}\|_0 \right] \leq C. \] (4.25)

Putting all these estimates together, the right-hand side of (4.20) may be bounded above by

\[ 2\epsilon C_4 (\|w_x\|_0 + \|w_y\|_0) + C_3 (\|w_x\|^2_0 + \|w_y\|^2_0), \] (4.26)
where $C_3$ and $C_4$ are order-one quantities. The following is then seen to hold from (4.19)

\[
\|w_x\|_0^2 + \|w_y\|_0^2 \leq \int_0^t \left[ 2\epsilon C_4 (\|w_x\|_0 + \|w_y\|_0) + C_3 (\|w_x\|_0^2 + \|w_y\|_0^2) \right] dt. \tag{4.27}
\]

Let $A_1(t) = [\|w_x\|_0^2 + \|w_y\|_0^2]^{1/2}$. Observe that

\[
(\|w_x\|_0 + \|w_y\|_0)^2 = \|w_x\|_0^2 + \|w_y\|_0^2 + 2\|w_x\|_0 \|w_y\|_0 \leq 2(\|w_x\|_0^2 + \|w_y\|_0^2), \tag{4.28}
\]

so that

\[
\|w_x\|_0 + \|w_y\|_0 \leq \sqrt{2} A_1(t). \tag{4.29}
\]

Therefore,

\[
\frac{d}{dt} [\|w_x\|_0^2 + \|w_y\|_0^2] \leq 2\epsilon C_4 (\|w_x\|_0 + \|w_y\|_0) + C_3 (\|w_x\|_0^2 + \|w_y\|_0^2), \tag{4.30}
\]

which is equivalent to

\[
\frac{d}{dt} A_1^2(t) \leq 2\epsilon C_4 \sqrt{2} A_1(t) + C_3 A_1^2(t) \tag{4.31}
\]

or

\[
\frac{d}{dt} A_1(t) \leq \epsilon C_4 \sqrt{2} + \frac{1}{2} C_3 A_1(t), \tag{4.32}
\]

and hence by a variant of Gronwall’s inequality, we obtain

\[
A_1(t) \leq 2\sqrt{2} \epsilon \left( \frac{C_4}{C_3} \right) \left( e^{(1/2)C_3 t} - 1 \right) \leq 2\sqrt{2} \epsilon t C_4 e^{(1/2)C_3} = \epsilon t M_1. \tag{4.33}
\]

We thus infer that

\[
\|w_x\|_0 \leq \epsilon t M_1, \\
\|w_y\|_0 \leq \epsilon t M_1 \tag{4.34}
\]

for $0 \leq t \leq 1$. Since $C_3$ and $C_4$ are order-one quantities, $M_1$ is also an order-one quantity.

For $j = 2$, integrate (4.12) and (4.13) by parts, combine the two operations to get the following:

\[
\int_{\mathbb{R}^2} \left[ w_{xx}^2 + \epsilon w_{xxx}^2 + w_{yy}^2 + \epsilon w_{xyy}^2 \right] dx dy = \int_0^t \int_{\mathbb{R}^2} \left[ 2\epsilon w_{xx} u_{xxxx} + 2\epsilon w_{yy} u_{yyyy} + 6w_x w_{xx} u_{xx} - 4w_y w_{yy} u_{xy} + 2w w_{xx} u_{xx} - w w_{yy} u_{xy} - 4w_x w_{xx}^2 - 2w_{yy}^2 u_x \right] dx dy d\tau. \tag{4.35}
\]
Using the differential equation satisfied by \( u \), we also obtain the following estimates, valid for \( 0 \leq \tau \leq 1 \):

\[
\sup_{\tau \geq 0} \left\| u_{xxxx} \right\|_0 \\
\leq \sup_{\tau \geq 0} \left\{ \left\| u_{xxxxx} \right\|_0 + \left\| u_{xxx} \right\|_0^{5/4} \left\| u_x \right\|_0^{1/2} \left\| u_{xxx} \right\|_0^{1/4} \right\} + 4 \left\| u_{xxx} \right\|_0^{1/4} \left\| u_x \right\|_0^{1/2} \left\| u_{xxx} \right\|_0^{1/4} \left\| u_{xxx} \right\|_0 \\
+ 4 \left\| u_{xxx} \right\|_0^{1/4} \left\| u_x \right\|_0^{1/2} \left\| u_{xxx} \right\|_0^{1/4} \left\| u_{xxx} \right\|_0 \\
+ \left\| u_{xxxxxxx} \right\|_0 + \left\| u_{xxx} \right\|_0 \leq C^2. \tag{4.38}
\]

Similarly,

\[
\sup_{\tau \geq 0} \left\| u_{xxxyy} \right\|_0 \\
\leq \sup_{\tau \geq 0} \left\{ \left\| u_{xxxyy} \right\|_0 + 8 \left\| u_{xxxyy} \right\|_0 \left\| u_{xxx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/2} \left\| u_{xxx} \right\|_0^{1/4} \right\} + 14 \left\| u_{xx} \right\|_0^{5/4} \left\| u_{yy} \right\|_0^{1/2} \left\| u_{xxxy} \right\|_0^{1/4} + 6 \left\| u_{xx} \right\|_0^{1/4} \left\| u_y \right\|_0^{1/2} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0 \\
+ 2 \left\| u_{yy} \right\|_0^{1/4} \left\| u_{xxxy} \right\|_0^{1/2} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0 + 4 \left\| u_y \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/2} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0 \\
+ 2 \left\| u \right\|_0^{1/4} \left\| u_y \right\|_0^{1/2} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0 + \left\| u_{xxxx} \right\|_0 + \left\| u_{yyyy} \right\|_0 \leq C^2 \}. \tag{4.39}
\]

Putting all these estimates together, the right of (4.35) is bounded by

\[
2\epsilon C_6 \left\| w_x \right\|_0 + \left\| w_{yy} \right\|_0 + C_5 \left( \left\| w_{xx} \right\|_0^2 + \left\| w_{yy} \right\|_0^2 \right), \tag{4.40}
\]

From the anisotropic Sobolev inequalities, we get the following estimates:

\[
\left\| u_{xxyy} \right\|_\infty \leq 2 \left\| u_{xx} \right\|_0^{1/4} \left\| u_{yy} \right\|_0^{1/2} \left\| u_{xxx} \right\|_0^{1/4} \left\| u_{xxxx} \right\|_0 \leq C, \tag{4.37}
\]

\[
\left\| u_{xxx} \right\|_\infty \leq 2 \left\| u_{xxx} \right\|_0^{1/4} \left\| u_{xx} \right\|_0^{1/2} \left\| u_{xxxxx} \right\|_0 \leq C.
\]
where from previous estimates we already obtained \( \| w \|_0 \leq \epsilon tM_0 \leq C_0, \| w_x \|_0 \leq \epsilon t\tilde{M}_1 \leq C_1, \| w_y \|_0 \leq \epsilon tM_1 \leq C_1 \) for \( 0 \leq t \leq 1 \). Consequently, we have that

\[
\| w_{xx} \|_0^2 + \| w_{yy} \|_0^2 \leq \int_0^t \left[ 2\epsilon C_6 (\| w_{xx} \|_0 + \| w_{yy} \|_0) + C_5 (\| w_{xx} \|_0^2 + \| w_{yy} \|_0^2) \right] d\tau, \tag{4.41}
\]

where \( C_5 \), and \( C_6 \) are order-one constants. Let

\[
A_2(t) = \left[ \| w_{xx} \|_0^2 + \| w_{yy} \|_0^2 \right]^{1/2}. \tag{4.42}
\]

Note that

\[
(\| w_{xx} \|_0 + \| w_{yy} \|_0)^2 = \| w_{xx} \|_0^2 + \| w_{yy} \|_0^2 + 2\| w_{xx} \|_0 \| w_{yy} \|_0 \leq 2(\| w_{xx} \|_0^2 + \| w_{yy} \|_0^2), \tag{4.43}
\]

so that

\[
\| w_{xx} \|_0 + \| w_{yy} \|_0 \leq \sqrt{2}A_2(t), \tag{4.44}
\]

and (4.44) is equivalent to

\[
\frac{d}{dt} \left[ \| w_{xx} \|_0^2 + \| w_{yy} \|_0^2 \right] \leq 2\epsilon C_6 (\| w_{xx} \|_0 + \| w_{yy} \|_0) + C_5 (\| w_{xx} \|_0^2 + \| w_{yy} \|_0^2), \tag{4.45}
\]

from which we have

\[
\frac{d}{dt} A_2^2(t) \leq \epsilon C_6 \sqrt{2}A_2(t) + C_5 A_2^2(t) \tag{4.46}
\]

or

\[
\frac{d}{dt} A_2(t) \leq 2\epsilon C_6 \sqrt{2} + \frac{1}{2} C_5 A_2(t). \tag{4.47}
\]

Apply Gronwall’s inequality to obtain

\[
A_2(t) \leq 2\sqrt{2}\epsilon \left( \frac{C_6}{C_5} \right) (e^{(1/2)C_5t} - 1) \leq 2\sqrt{2}\epsilon t C_6 e^{(1/2)C_5} = \epsilon tM_2. \tag{4.48}
\]

From (4.44), we infer that

\[
\| w_{xx} \|_0 \leq \epsilon tM_2, \tag{4.49}
\]
\[
\| w_{yy} \|_0 \leq \epsilon tM_2.
\]
For the general case \( j \), the procedure for obtaining a bound on \( \| \partial^j_x w \|_0 + \| \partial^j_y w \|_0 \) is similar to that followed above in the cases \( j = 0 \), \( j = 1 \), and \( j = 2 \). Suppose inductively that for \( j < k \), where \( k > 1 \), there have been established bounds of the form

\[
\| \partial^j_x w \|_0 + \| \partial^j_y w \|_0 \leq \epsilon \left( \frac{C_{2j}}{C_{2j-1}} \right) (e^{C_{2j-1}t} - 1) \leq \epsilon t C_{2j} e^{C_{2j-1}} = \epsilon t M_j
\]  

for \( t \in [0, 1] \), where \( C_{2j-1} \) and \( C_{2j} \) are both order-one quantities. The goal now is to establish the proof for \( j = k \). Before we proceed with the proof, we add (4.12) and (4.13) together to get the relation

\[
\int_{\mathbb{R}^2} [ (\partial^k_x w)^2 + \epsilon (\partial^{(k+1)}_x w)^2 + (\partial^k_y w)^2 + \epsilon (\partial^k_y w_x)^2 ] dx dy = t \int_{\mathbb{R}^2} \partial^k_x w \left[ 2\epsilon \partial^{(k+2)}_x u \tau - 2\partial^{(k+1)}_x \left( wu + \frac{1}{2} w^2 \right) \right] dx dy dt
\]

\[
+ \int_{0}^{t} \int_{\mathbb{R}^2} \partial^k_y w \left[ 2\epsilon \partial^k_y u_{x\tau} - \partial^k_y \left( wu + \frac{1}{2} w^2 \right) \right] dx dy dt. 
\]  

Using Leibniz rule, (4.51) may be written as

\[
\int_{\mathbb{R}^2} [ (\partial^k_x w)^2 + \epsilon (\partial^{(k+1)}_x w)^2 + (\partial^k_y w)^2 + \epsilon (\partial^k_y w_x)^2 ] dx dy = 2\epsilon \int_{0}^{t} \int_{\mathbb{R}^2} \partial^k_x w \partial^{(k+2)}_x u \tau dx dy dt
\]

\[-2 \int_{0}^{t} \int_{\mathbb{R}^2} \sum_{j=0}^{k+1} \alpha_j \left\{ \frac{1}{2} \partial^{(k+1-j)}_x \partial^j_x w + \partial^{(k+1-j)}_x \partial^j_x u \right\} (\partial^k_x w) dx dy dt \]

\[+ 2\epsilon \int_{0}^{t} \int_{\mathbb{R}^2} \partial^k_y w \partial^k_y u_{x\tau} dx dy dt \]

\[-2 \int_{0}^{t} \int_{\mathbb{R}^2} \sum_{j=0}^{k} \beta_j \left\{ \partial^{(k-j)}_x \partial^j_y w_x + \partial^{(k-j)}_x \partial^j_y u + \partial^{(k-j)}_y \partial^j_y w_{x\tau} \right\} (\partial^k_y w) dx dy dt. 
\]  

(4.52)
Here, the $\alpha_j$ and $\beta_j$ are the constants that appear in Leibniz rule. Separating the top-order derivatives and directly the rest estimating, we have that

\[
\int_{\mathbb{R}^2} \left[ (\partial_x^k w)^2 + \epsilon (\partial_x^{k+1} w)^2 + (\partial_y^k w)^2 + \epsilon (\partial_y^k w_x)^2 \right] dx dy \\
\leq 2\epsilon \int_0^t \|\partial_x^k w\|_0 \|\partial_x^{k+1} u_t\|_0 d\tau - 2 \int_0^t \int_{\mathbb{R}^2} (w\partial_x^k w\partial_x^{k+1} w + u\partial_x^k w\partial_x^{k+1} w) dx dy d\tau \\
+ \int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^{k+1} \alpha_j |\partial_x^j w\partial_x^{k+1-j} w\partial_x^j w| dx dy d\tau + 2 \int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^{k+1} \alpha_j |\partial_x^j w\partial_x^j u\partial_x^{k+1-j} w| dx dy d\tau \\
+ 2\epsilon \int_0^t \|\partial_x^k w\|_0 \|\partial_x^k u_{x\tau}\|_0 dx dy d\tau
\]

- \[
-2 \int_0^t \int_{\mathbb{R}^2} (u\partial_y^k w\partial_y^j w_x + u_x\partial_y^k w_x\partial_y^j w + w_x\partial_y^k w\partial_x^j w) dx dy d\tau
\]

+ \[
+ 2 \int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^k \beta_j |\partial_y^j w\partial_y^{k-j} w_x\partial_y^j u| dx dy d\tau + 2 \int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^k \beta_j |\partial_y^j w\partial_y^j u_x\partial_y^{k-j} w| dx dy d\tau
\]

+ \[
+ 2 \int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^k \beta_j |\partial_y^j w\partial_y^{k-j} w_x\partial_y^j w| dx dy d\tau.
\]

The induction hypothesis (4.50) assures us that on the time interval $[0, t]$, $\|\partial_x^j w\|_0$, $|\partial_x^j w|_\infty$, $\|\partial_y^j w\|_0$, $\|\partial_y^j w_x\|_0$, $\|\partial_y^j w_x\|_\infty$, and $|\partial_y^j w|_\infty$ are bounded by order-one constants if $0 \leq j \leq k - 1$, and $0 \leq i \leq k - 2$. Using the elementary inequalities, the following estimates may be obtained:

\[
|\partial_x^j u|_\infty \leq 2\|\partial_x^j u\|_0^{1/4} \|\partial_x^j u_y\|_0^{1/2} \|\partial_x^{j+2} u\|_0^{1/4} \leq C,
\]

(4.54)

\[
|\partial_y^j u|_\infty \leq 2\|\partial_y^j u\|_0^{1/4} \|\partial_y^{j+1} u\|_0^{1/2} \|\partial_y^j u_{x\tau}\|_0^{1/4} \leq C,
\]

and from the differential equation satisfied by $u$, we get the following estimates:

\[
\sup_{\tau \geq 0} \|\partial_x^{k+2} u_t\|_0 \leq \sup_{\tau \geq 0} \left\{ \|\partial_x^{k+3} u\|_0 + 3 \sum_{j=0}^k \alpha_j \|\partial_x^{k+1-j} u\|_0 \|\partial_x^{j+2} u\|_0 \\
+ \sum_{j=0}^k \beta_j \|\partial_x^{k-j} u\|_0 \|\partial_x^{j+3} u\|_0 + \|\partial_x^{k+5} u\|_0 + \|\partial_x^{k+1} u_{y\tau}\|_0 \right\} \leq C.
\]

(4.55)
Similarly,

\[
\sup_{\tau \geq 0} ||\partial_y^k u_{xxx}||_0 \leq \sup_{\tau \geq 0} \left\{ ||\partial_y^k u_{xxx}||_0 + 3 \sum_{j=0}^k y_j ||\partial_y^{k-j} u_x||_0 ||\partial_y^j u_{xx}||_0 \right. \\
\left. + \sum_{j=0}^k \delta_j ||\partial_y^{k-j} u||_0 ||\partial_y^j u_{xxx}||_0 + ||\partial_y^k u_{xxxx}||_0 + ||\partial_y^{k+2} u_x||_0 \right\} \leq C
\]

(4.56)

for \( 0 \leq j \leq k + 1 \), independent of \( \tau \geq 0 \), and the \( \alpha_j, \beta_j, y_j \), and \( \delta_j \) are the constants that appear in Leibniz rule. Because of Theorems 3.1 and 3.2, \( |w_{x}|_{\infty}, |w_{y}|_{\infty}, \text{and } |w|_{\infty} \) are similarly bounded. The second and the sixth integral on the right-hand side of (4.53) are bounded, respectively, as follows:

\[
- \int_0^t \int_{\mathbb{R}^2} (w_x + u_x) (\partial_y^k w)^2 \, dx \, dy \, d\tau \leq C \int_0^t ||\partial_y^k w||_0^2 \, d\tau,
\]

\[
-2 \int_0^t \int_{\mathbb{R}^2} \left( \frac{1}{2} u_x + w_x \right) (\partial_y^k w)^2 \, dx \, dy \, d\tau \leq C \int_0^t ||\partial_y^k w||_0^2 \, d\tau,
\]

(4.57)

where, provided \( 0 \leq t \leq 1 \), \( C \) may be inferred to be an order-one quantity. The other integrals on the right side of (4.53) may be estimated as follows:

\[
\int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^{k+1} \alpha_j \left( ||\partial_y^{(k+1)-j} w \partial_y^j w|| + 2 ||\partial_y^{(k+1)-j} w \partial_y^j u|| + ||\partial_y^{(k+1)-j} w \partial_y^j u \partial_x \partial_y^{(k+1)-j} w|| \right) \, dx \, dy \, d\tau \\
+ 2 \int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^k \beta_j \left( ||\partial_y^j w \partial_y^{k-j} w \partial_y^j u|| + ||\partial_y^j w \partial_y^j u \partial_x \partial_y^{k-j} w|| \right) \, dx \, dy \, d\tau \\
+ 2 \int_0^t \int_{\mathbb{R}^2} \sum_{j=1}^k \beta_j ||\partial_y^j w \partial_y^{k-j} w \partial_y^j w_x|| \, dx \, dy \, d\tau \\
\leq C \int_0^t ||w_x||_{\infty} ||\partial_y^k w||_0^2 \, d\tau + C \varepsilon \int_0^t \left[ ||\partial_y^k w||_0 \sum_{j=2}^{k+1} M_{k+1-j} M_j \tau^2 \right] \, d\tau \\
+ C \int_0^t ||u_x||_{\infty} ||\partial_y^k w||_0^2 \, d\tau + C \varepsilon \int_0^t \left[ ||\partial_y^k w||_0 \sum_{j=2}^{k+1} N_{k+1-j} N_j \tau^2 \right] \, d\tau \\
+ C \varepsilon \int_0^t ||\partial_y^k w||_0 \left[ ||u_x||_{\infty} ||\partial_y^{k-1} w||_0 + \sum_{j=2}^k P_{k-j} P_j \tau^2 \right] \, d\tau \\
+ C \varepsilon \int_0^t ||\partial_y^k w||_0 \left[ ||\partial_y^{k-1} w||_0 ||u_{xy}||_{\infty} + \sum_{j=2}^k Q_{k-j} Q_j \tau^2 \right] \, d\tau \\
+ C \varepsilon \int_0^t ||\partial_y^k w||_0 \left[ ||\partial_y^{k-1} w||_0 ||w_{xy}|_{\infty} + \sum_{j=2}^k R_{k-j} R_j \tau^2 \right] \, d\tau,
\]

(4.58)
valid at least for $0 \leq t \leq 1$. The constants appearing in these inequalities are order one. Hence, for $0 \leq t \leq 1$,

$$\|\partial^k_w\|_0 + \|\partial^k_x\|_0^2 \leq \int_0^t \left\{ c C_{2k} \left[ \|\partial^k_w\|_0 + \|\partial^k_x\|_0 + C_{2k-1} \left[ \|\partial^k_w\|_0 + \|\partial^k_x\|_0 \right] \right] \right\} dt,$$

(4.59)

where $C_{2k-1}$ and $C_{2k}$ are order-one quantities. As previously seen, if

$$A_k(t) = \left[ \|\partial^k_w\|_0^2 + \|\partial^k_x\|_0^2 \right]^{1/2},$$

(4.60)

then an application of Gronwall’s inequality will lead to

$$A_k(t) \leq \sqrt{2}e \left( \frac{C_{2k}}{C_{2k-1}} \right) \left( e^{C_{2k-1}t} - 1 \right) \leq \sqrt{2}etC_{2k}e^{C_{2k-1}} = \epsilon tM_k.$$

(4.61)

We therefore infer that

$$\|\partial^k_w\|_0 \leq \epsilon tM_k,$$

(4.62)

$$\|\partial^k_x\|_0 \leq \epsilon tM_k.$$

The result (4.50) for $j = k$ now follows and the inductive step is completed.

It is worth noting that the constants $C_{2k-1}$ and $C_{2k}$ depend only on $\|g_{jj}\|_0$ for $0 \leq j \leq k + 5$. This concludes the proof of Theorem 4.2.

**Proof of Theorem 4.1.** From (4.5), we have

$$u(x, y, t) = \epsilon^{-1}\eta(\epsilon^{-1/2}x + \epsilon^{-3/2}t, \epsilon^{-1}y, \epsilon^{-3/2}t),$$

$$v(x, y, t) = \epsilon^{-1}\xi(\epsilon^{-1/2}x + \epsilon^{-3/2}t, \epsilon^{-1}y, \epsilon^{-3/2}t).$$

(4.63)

Inverting the above relations, we get

$$\eta(x, y, t) = \epsilon u(\epsilon^{1/2}x - \epsilon^{3/2}t, \epsilon y, \epsilon^{3/2}t),$$

$$\xi(x, y, t) = \epsilon v(\epsilon^{1/2}x - \epsilon^{3/2}t, \epsilon y, \epsilon^{3/2}t).$$

(4.64)

It follows that

$$\partial^j_k \eta(x, y, t) = \epsilon^{j/2+1}\partial^j_k u(\epsilon^{1/2}x - \epsilon^{3/2}t, \epsilon y, \epsilon^{3/2}t),$$

$$\partial^j_k \xi(x, y, t) = \epsilon^{j/2+1}\partial^j_k v(\epsilon^{1/2}x - \epsilon^{3/2}t, \epsilon y, \epsilon^{3/2}t).$$

(4.65)

Thus,

$$\|\partial^j_k (\eta(\cdot, \cdot, t) - \xi(\cdot, \cdot, t))\|_0^2 = \epsilon^{j+2} \int_{\mathbb{R}^2} \left[ \partial^j_k u(\epsilon^{1/2}x - \epsilon^{3/2}t, \epsilon y, \epsilon^{3/2}t) - \partial^j_k v(\epsilon^{1/2}x - \epsilon^{3/2}t, \epsilon y, \epsilon^{3/2}t) \right]^2 dx dy.$$
Now, change variables by letting \( z_1 = \varepsilon^2 x - \varepsilon^{3/2} t, \ z_2 = \varepsilon y, \) and \( dx \, dy = \left| J \right| dz_1 dz_2 = \varepsilon^{-3/2} dz_1 dz_2. \) The relation above then becomes

\[
\left\| \partial_x^j (\eta(\cdot, \cdot, t) - \xi(\cdot, \cdot, t)) \right\|_0^2 = e^{j+1/2} \left[ \partial_x^j u(e^{1/2} x - e^{3/2} t, \varepsilon y, \varepsilon^{3/2} t) - \partial_x^j v(e^{1/2} x - e^{3/2} t, \varepsilon y, \varepsilon^{3/2} t) \right]^2 dz_1 dz_2 \]

(4.67)

for \( 0 \leq \varepsilon^{3/2} t \leq 1. \) Hence if \( 0 \leq t \leq e^{-3/2}, \) then

\[
\left\| \partial_x^j \eta(\cdot, \cdot, t) - \partial_x^j \xi(\cdot, \cdot, t) \right\|_0 \leq e^{j+1/2} M_j \left( \varepsilon^{3/2} t \right). \quad (4.68)
\]

Similarly,

\[
\partial_y^j \eta(x, y, t) = e^{j+1} \partial_y^j u(e^{1/2} x - e^{3/2} t, \varepsilon y, \varepsilon^{3/2} t), \quad (4.69)
\]

\[
\partial_y^j \xi(x, y, t) = e^{j+1} \partial_y^j v(e^{1/2} x - e^{3/2} t, \varepsilon y, \varepsilon^{3/2} t),
\]

so that

\[
\left\| \partial_y^j \eta(\cdot, \cdot, t) - \partial_y^j \xi(\cdot, \cdot, t) \right\|_0^2 = e^{2j+2} \left[ \partial_y^j u(e^{1/2} x - e^{3/2} t, \varepsilon y, \varepsilon^{3/2} t) - \partial_y^j v(e^{1/2} x - e^{3/2} t, \varepsilon y, \varepsilon^{3/2} t) \right]^2 dx \, dy
\]

(4.70)

for \( 0 \leq \varepsilon^{3/2} t \leq 1. \) Hence if \( 0 \leq t \leq e^{-3/2}, \) then

\[
\left\| \partial_y^j \eta(\cdot, \cdot, t) - \partial_y^j \xi(\cdot, \cdot, t) \right\|_0 \leq e^{j+1/2} M_j \left( \varepsilon^{3/2} t \right), \quad (4.71)
\]

where \( M_j \) is of order one.

\[ \square \]

**Corollary 4.3.** Assume the hypothesis in Theorem 4.1. Then, there are constants \( K_j \) such that

\[
\left| \partial_x^j \eta(x, y, t) - \partial_x^j \xi(x, y, t) \right|_\infty \leq e^{2j/2} K_j \left( \varepsilon^{3/2} t \right) \quad (4.72)
\]

for \( 0 \leq j \leq k/2 \) and \( 0 \leq t \leq e^{-3/2} \min \{T, T_0\}, \) and \( j \leq k/2. \)
Proof. Note that
\[
|\partial^j_x\eta(x, y, t) - \partial^j_x(x, y, t)|_\infty \leq 2||\partial^j_x(\eta - \xi)||_0^{1/4}||\partial^j_y(\eta_y - \xi_y)||_0^{1/2}||\partial^j_x+2(\eta - \xi)||_0^{1/4}.
\]
(4.73)

Now observe that
\[
||\partial^j_x\partial_y(\eta - \xi)||_0 \leq ||\partial^j_x(\eta - \xi)||_0^{1/2}||\partial^j_y(\eta - \xi)||_0^{1/2},
\]
so that
\[
|\partial^j_x(\eta - \xi)|_\infty \leq 2||\partial^j_x(\eta - \xi)||_0^{1/4}||\partial^j_y(\eta - \xi)||_0^{1/4}
\leq \left[\epsilon^{j/2+5/4}m\right]^{1/4}\left[\epsilon^{j/2+5/4}m_2\right]^{1/4}\left[\epsilon^{13/4}m_1\right]^{1/4}\left[\epsilon^{(j+2)/2+5/4}m_1\right]^{1/4}
= \epsilon^{j/8+5/16+2/j+5/16+13/16+13/16+13/16+13/16+13/16}m
= \epsilon^{j/8+5/16+2/j+5/16+13/16+13/16+13/16+13/16+13/16+13/16+13/16}m = \epsilon^{2j/2+\tilde{m}}(\epsilon^{3/2}t).
\]
(4.74)

From which, with \(j = 0\), we get the following interesting case:
\[
|\eta(x, y, t) - \xi(x, y, t)|_\infty \leq K_0\epsilon^{7/2}t
\]
(4.76)
holding for \(0 \leq t \leq \epsilon^{-3/2}\). Inequality (4.76) is exactly what was obtained when comparing solutions of the two linearized model evolution equations. Note in particular that at \(t = t_1 = \epsilon^{-3/2}\)
\[
|\eta(x, y, t_1) - \xi(x, y, t_1)|_\infty \leq K_0\epsilon^2,
\]
(4.77)
showing explicitly that the two solutions are the same in the formal order of accuracy \(\epsilon^2\) achieved by either model. Similarly, we state without proof the following corollary.

Corollary 4.4. Assume the hypothesis in Theorem 4.1. Then, there are constants \(K_j\) such that
\[
|\partial^j_y\eta(x, y, t) - \partial^j_y\xi(x, y, t)|_\infty \leq \epsilon^{2+j}K_j(\epsilon^{3/2}t)
\]
(4.78)
for \(0 \leq j \leq k - 2\) and \(0 \leq t \leq \epsilon^{-3/2}\) \(\min\{T, T_0\}\), and \(j \leq k/2 - 2\).

5. Remark

The same result is obtained by analyzing the solutions of the initial-value problems for the KP II and the BBM KP II equations. Indeed, that analysis was carried out by Mammeri in [11]. This was made known to us after the submission of this paper.

Space dynamics is a very general title that can accommodate a long list of activities. This kind of research started with the study of the motion of the stars and the planets back to the origin of astronomy, and nowadays it has a large list of topics. It is possible to make a division in two main categories: astronomy and astrodynamics. By astronomy, we can relate topics that deal with the motion of the planets, natural satellites, comets, and so forth. Many important topics of research nowadays are related to those subjects. By astrodynamics, we mean topics related to spaceflight dynamics.

It means topics where a satellite, a rocket, or any kind of man-made object is travelling in space governed by the gravitational forces of celestial bodies and/or forces generated by propulsion systems that are available in those objects. Many topics are related to orbit determination, propagation, and orbital maneuvers related to those spacecrafts. Several other topics that are related to this subject are numerical methods, nonlinear dynamics, chaos, and control.

The main objective of this Special Issue is to publish topics that are under study in one of those lines. The idea is to get the most recent researches and published them in a very short time, so we can give a step in order to help scientists and engineers that work in this field to be aware of actual research. All the published papers have to be peer reviewed, but in a fast and accurate way so that the topics are not outdated by the large speed that the information flows nowadays.

Before submission authors should carefully read over the journal’s Author Guidelines, which are located at http://www.hindawi.com/journals/mpe/guidelines.html. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
